Toussaint *et al.*, 2016

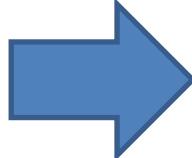

Henriques *et al.*, 2016; 2017

Objective

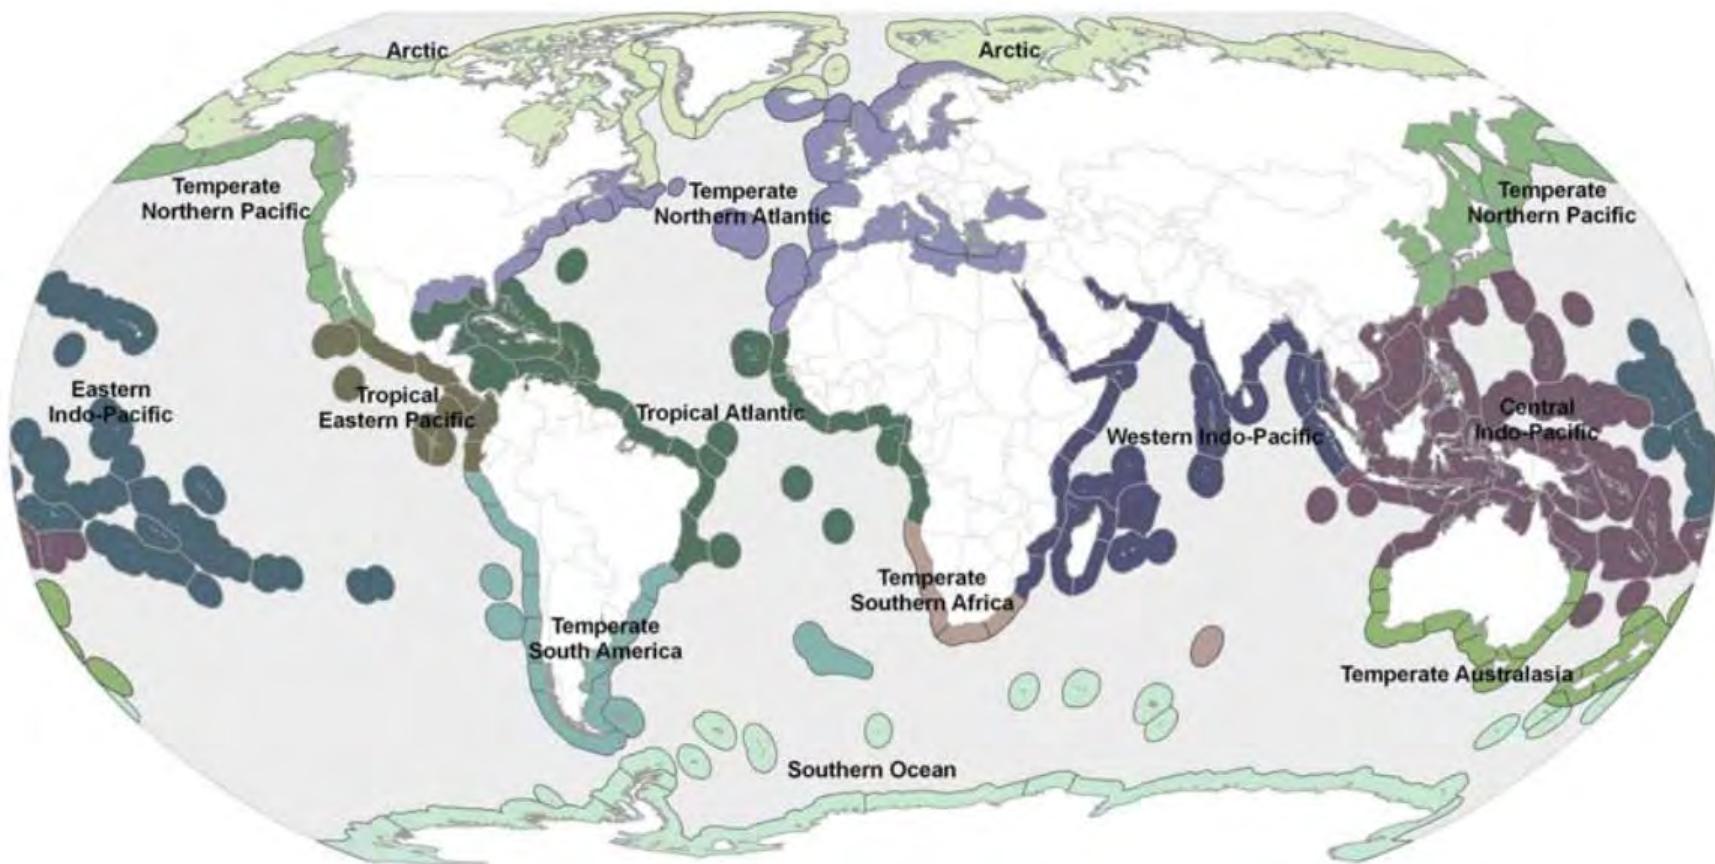

Characterize the variation patterns of functional diversity in the mangrove fish community in America

Data gathering

	Locality	Var1	Var..n
Sp1			
Sp2			
Sp3			
SpX

Measures

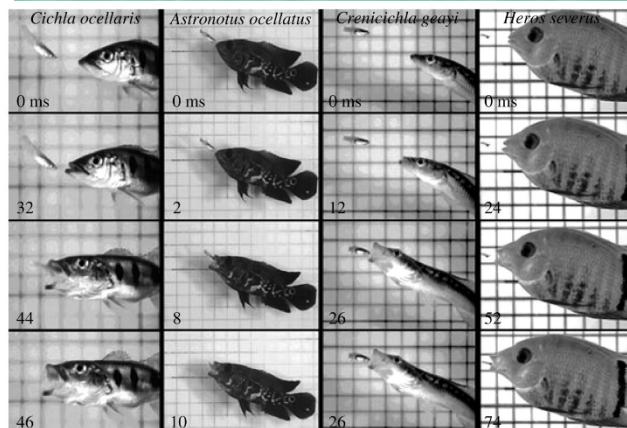

The *ratios* of the body parts reflect
functional traits

Functional traits

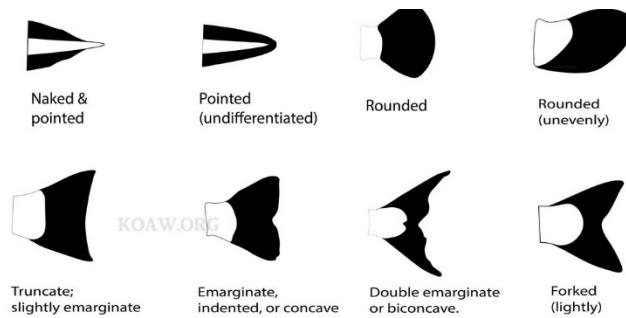

Habitat use → 4

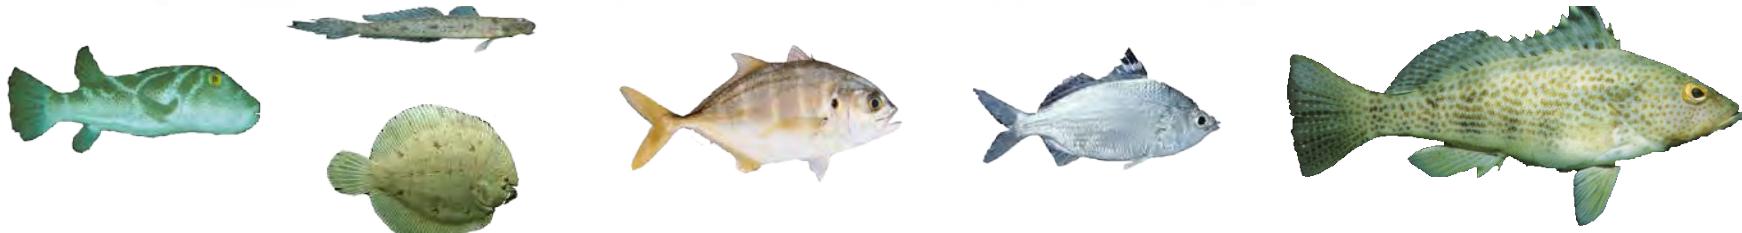

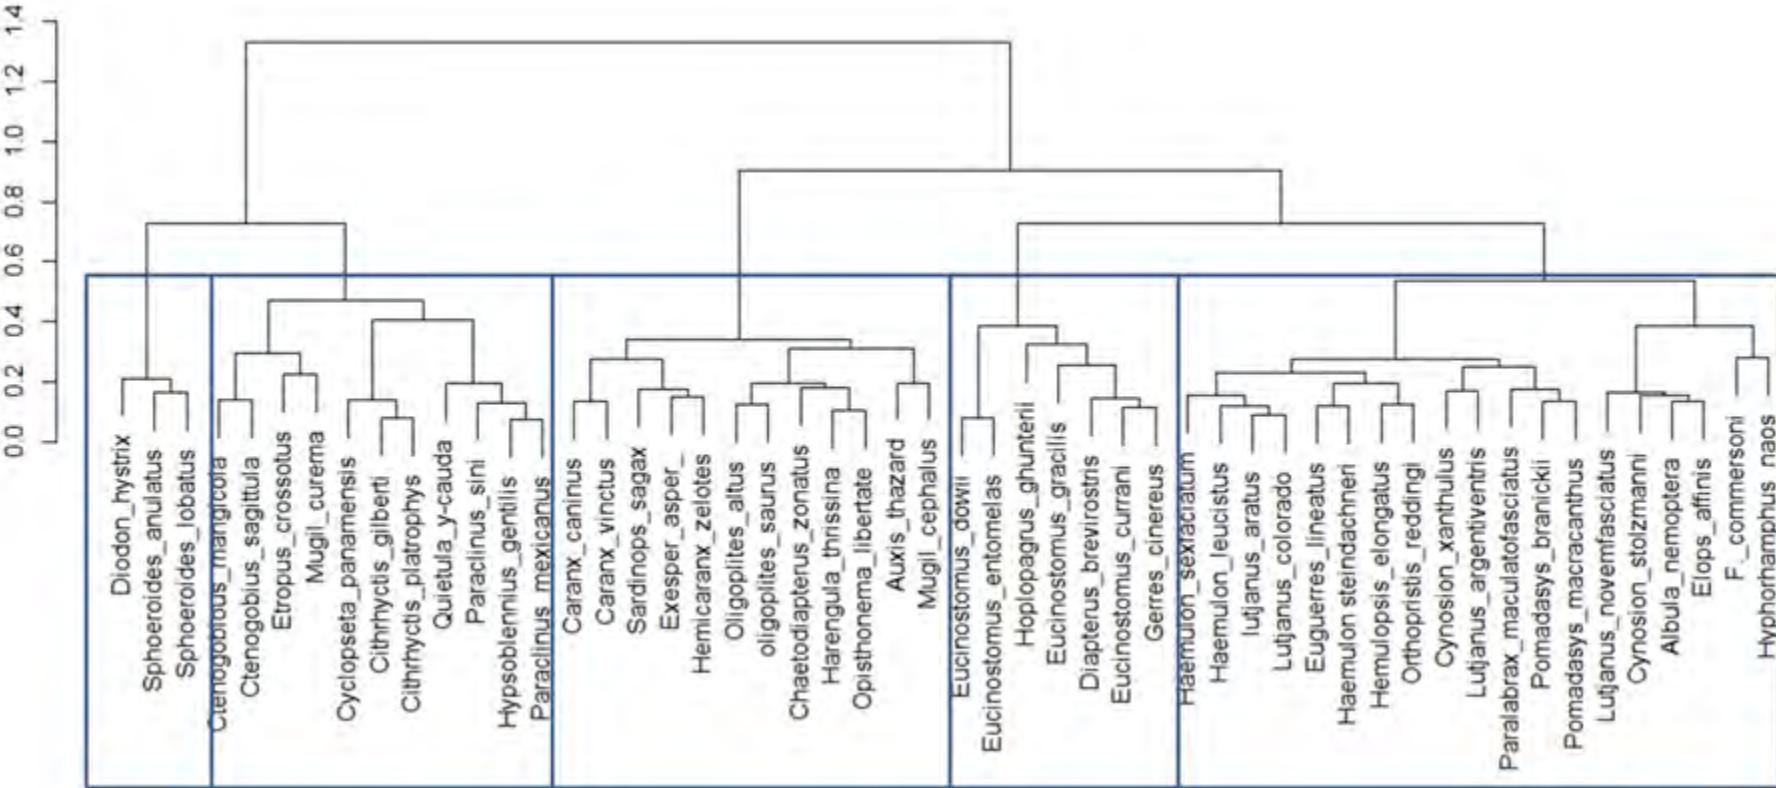

Feeding → 3

Locomotion → 2

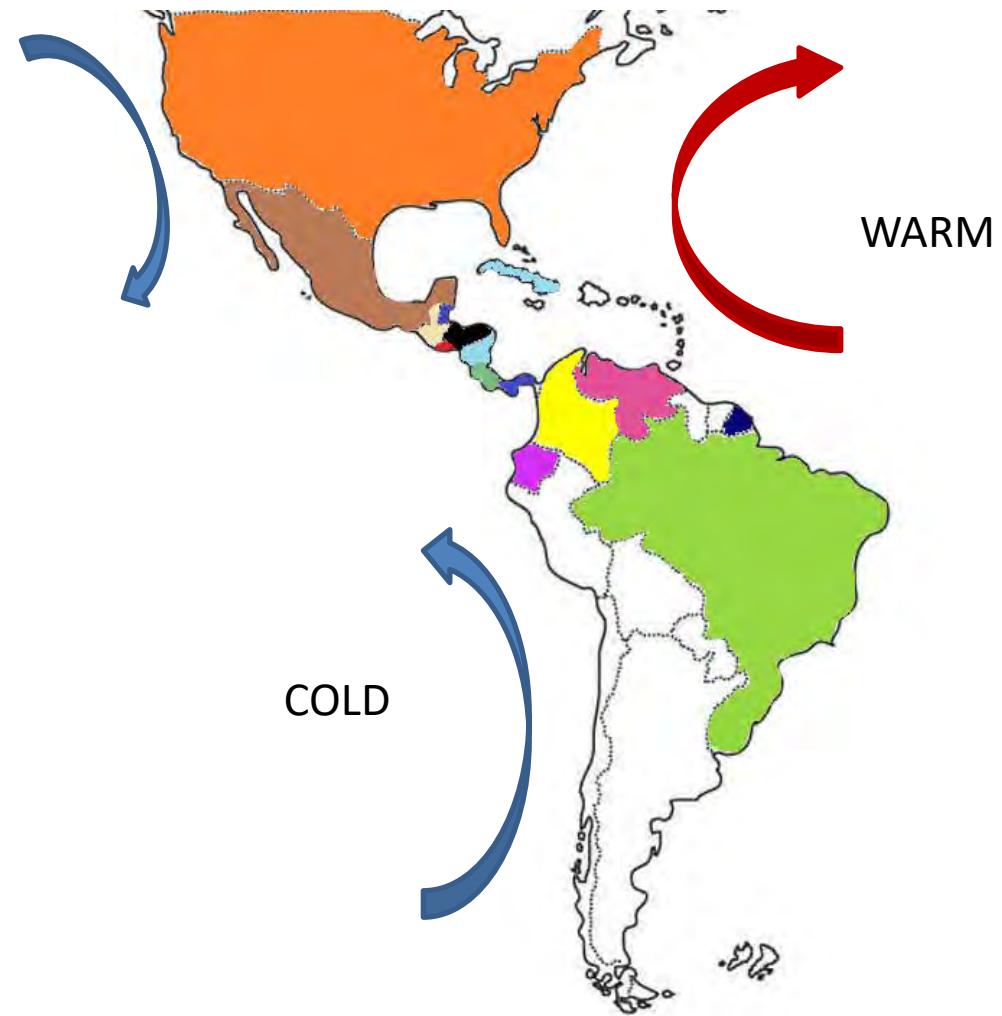

Functional groups

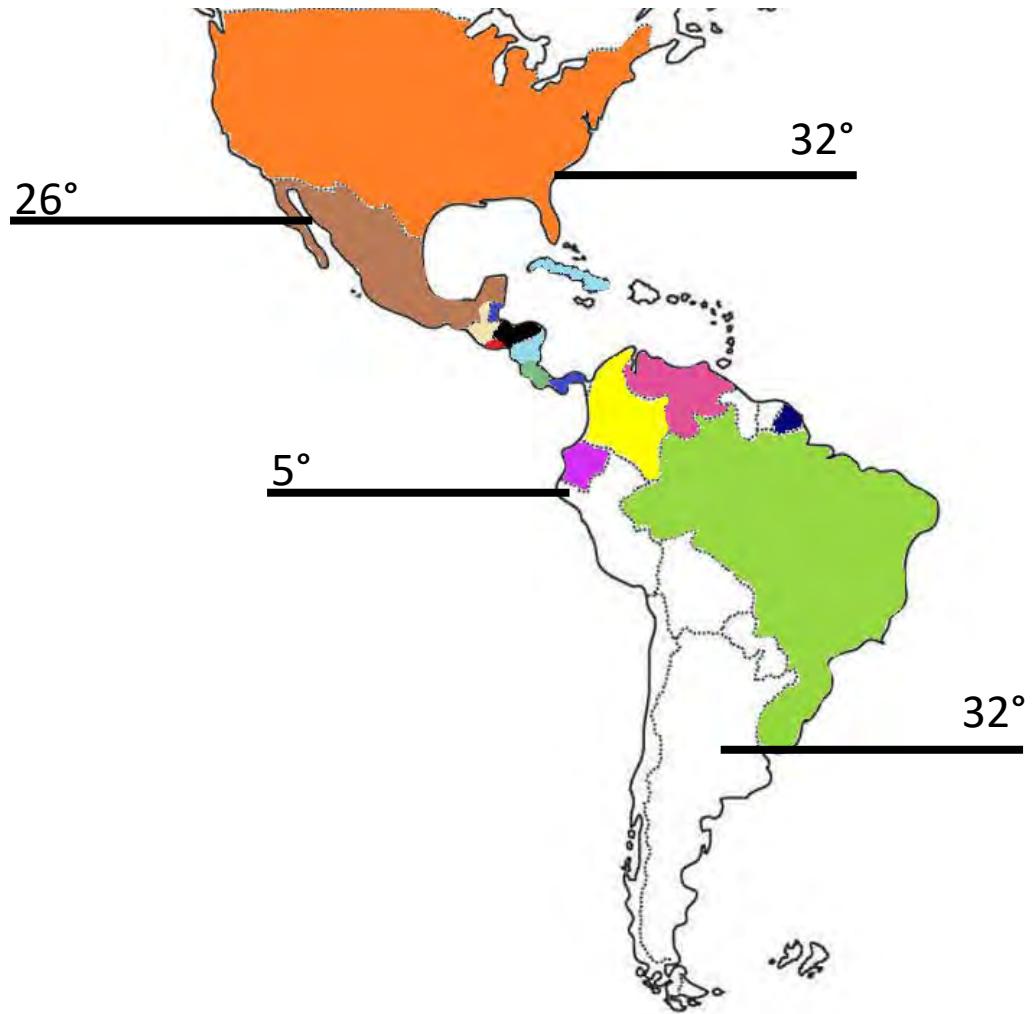

Results so far...

- 524 species total
 - 334 Atlantic
 - 194 Pacific
- Haemulidae 32
- Carangidae 28
- Gerreidae 22

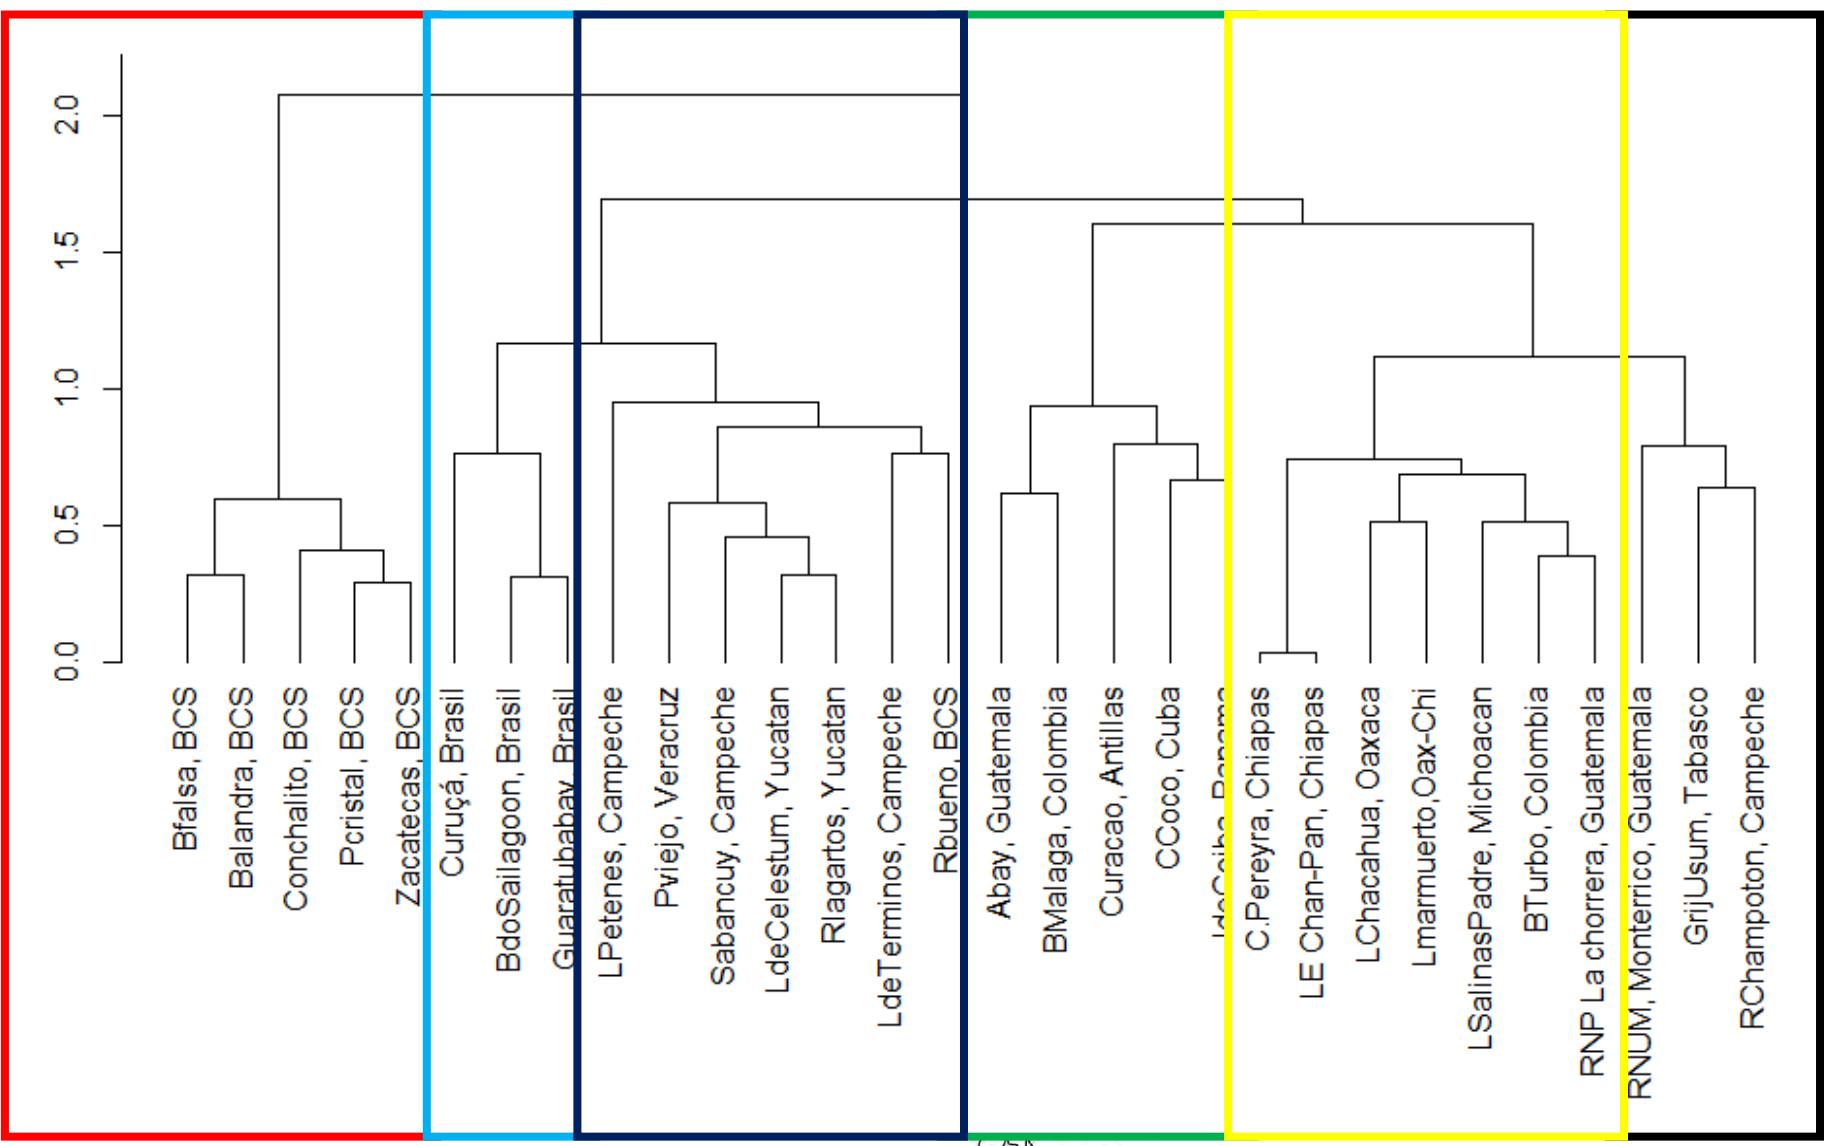

Results so far...

- 524 species total

Mangroves cluster zones

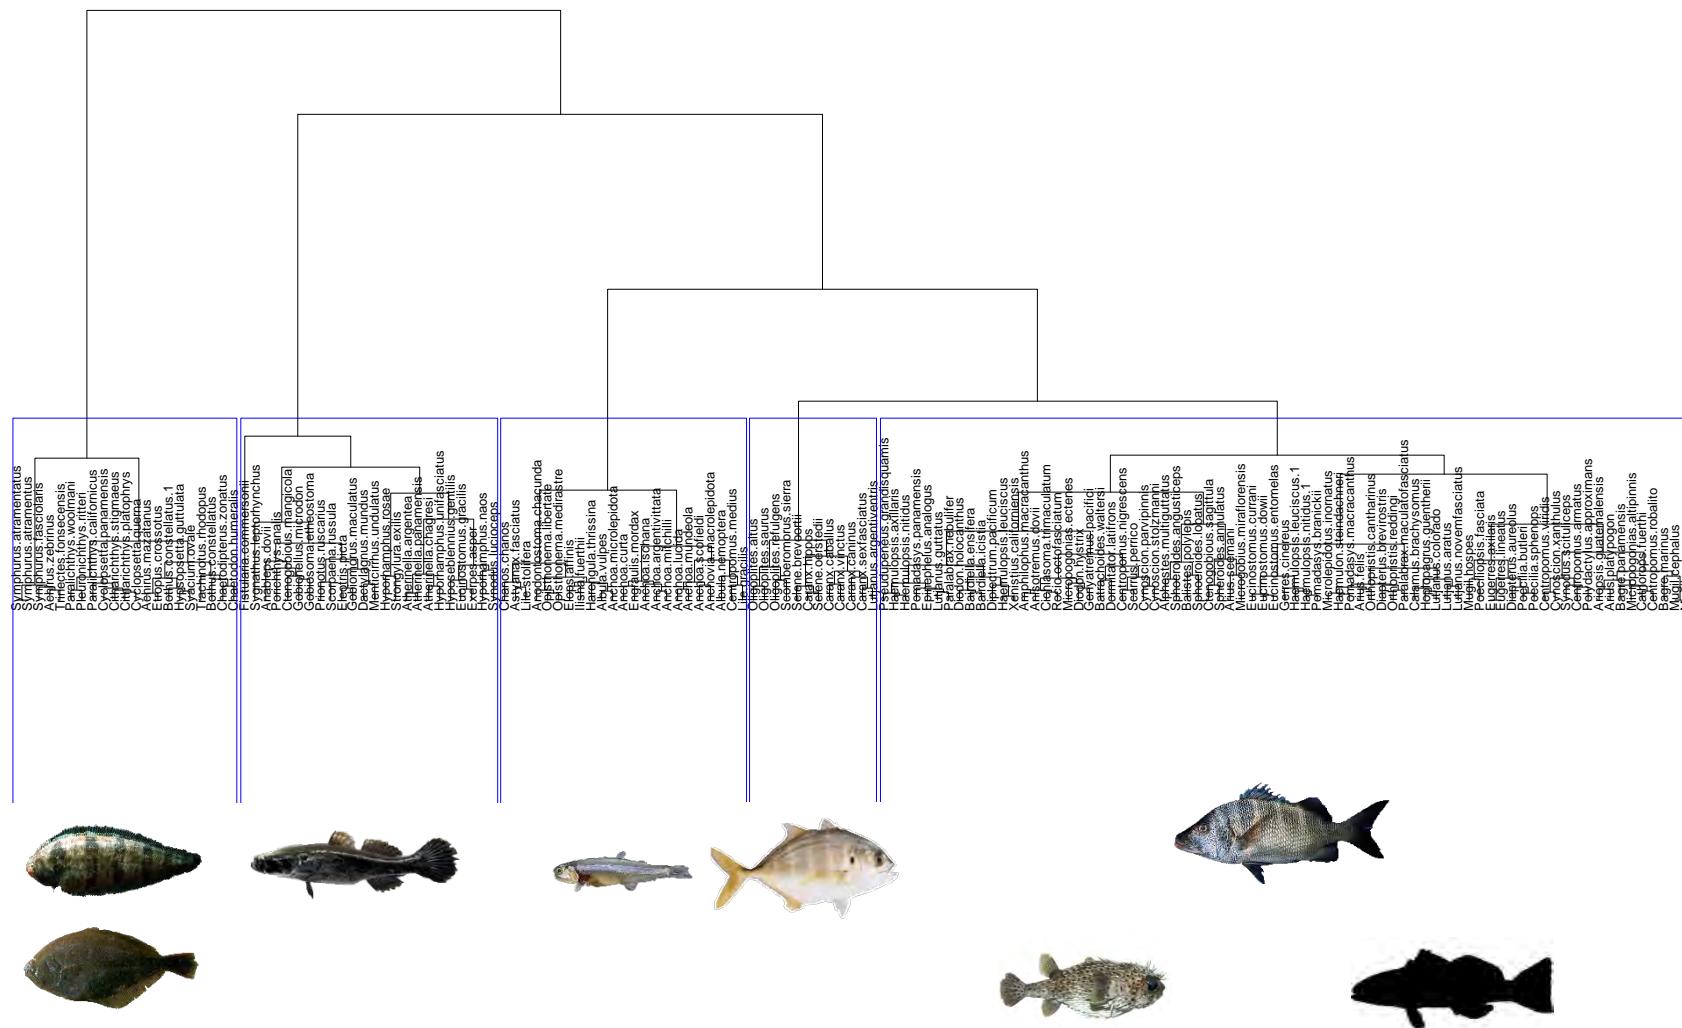

Regionalization

- Tropical Northwestern Atlantic is better explained with ecoregions
- The rest of the cluster groups relates more to the province level

Spalding *et al.* 2007

Mexican Pacific

High compressed benthic

Tubular benthic

Small pelagic

Pelagic predators

Generalistic

Functional structure

	BF BCS	PC BCS	Bal BCS	Con BCS	Zac BCS	LC OAX	LMM OAX- CHI	LSP MIC	LCP CHI	CP CHI

Summary

- Spalding province clasification seems to better represent the taxonomic grouping of mangrove fish.
- Five functional groups are define for the mangrove habitat (Mexican Pacific)
- Generalistic species are dominant
