

Zooplankton is the perfect candidate for
validating eDNA metabarcoding for analyzing
North Sea marine fauna

AIM:

Do we have sufficient reference data & appropriate methods to identify marine fauna in the North Sea?

The Approach

The Approach

Sampling

Helgoland (North Sea, German Bight)
19-27 June 2019

eDNA: ca. 260 L

Metabarcoding:

- COI: MetaZooGene db
- 18S V4: SILVA & PR2

The Approach

Sampling

Helgoland (North Sea, German Bight)
19-27 June 2019

eDNA: ca. 260 L

ZP net: ca. 120,000 L (150 & 500 µm)

Metabarcoding:

a) COI: MetaZooGene db

b) 18S V4: SILVA & PR2

Validation of metabarcoding

ZP net catches: metabarcoding vs. taxa identified by morphological characteristics:

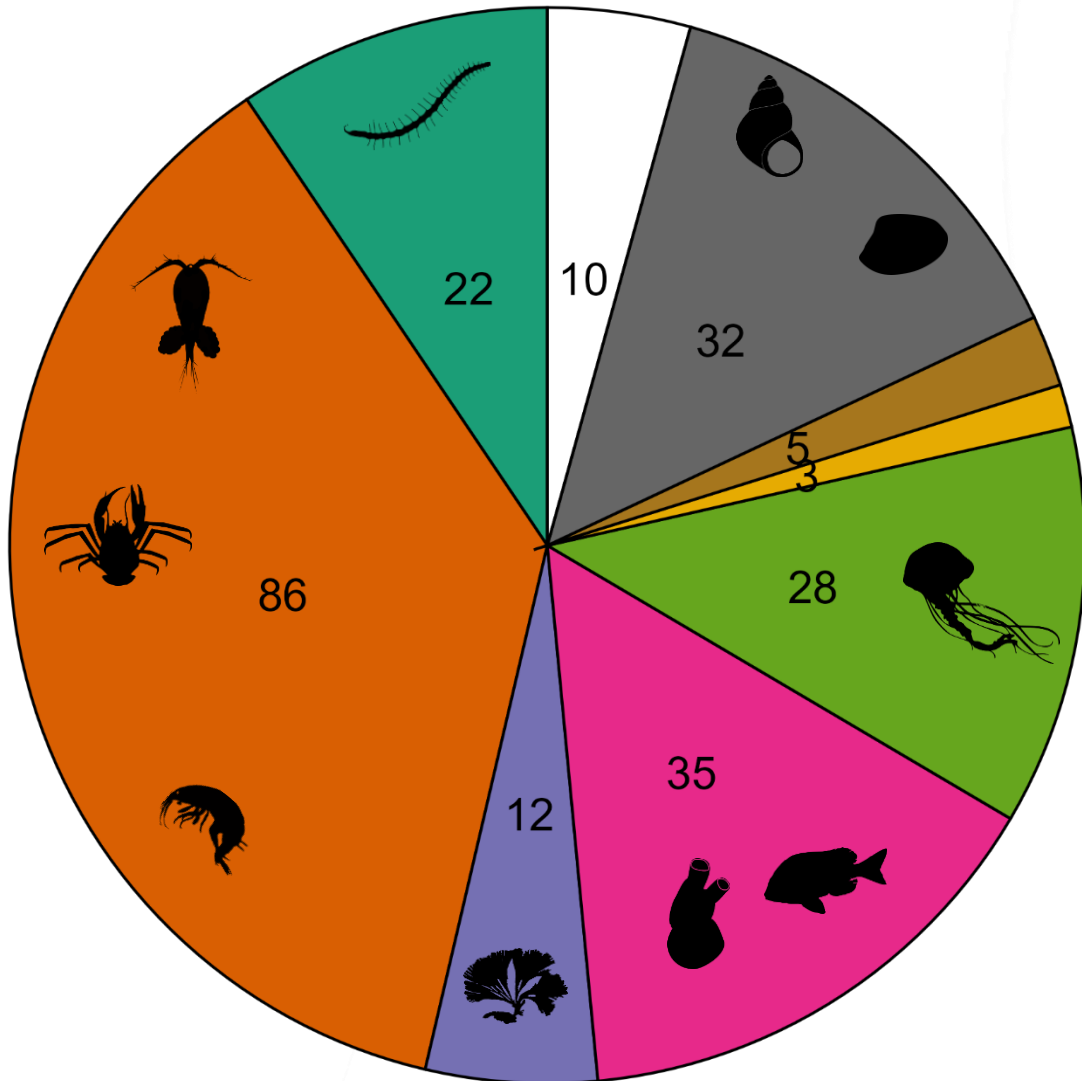

Which taxa do we **miss** by metabarcoding?

- Phoronida
- Asteroidea 
- (Chaetognatha)

Which phyla are **additionally** recovered by metabarcoding?

- + Rotifera 
- + Nemertea 

Detections ZP net catches

Phylum

-  Annelida
-  Arthropoda
-  Bryozoa
-  Chordata
-  Cnidaria
-  Ctenophora
-  Echinodermata
-  Mollusca
-  other : Entoprocta: 1

- Nematoda: 1
- Nemertea: 5
- Platyhelminthes: 1
- Rotifera: 2

233 species
13 phyla

Detections eDNA

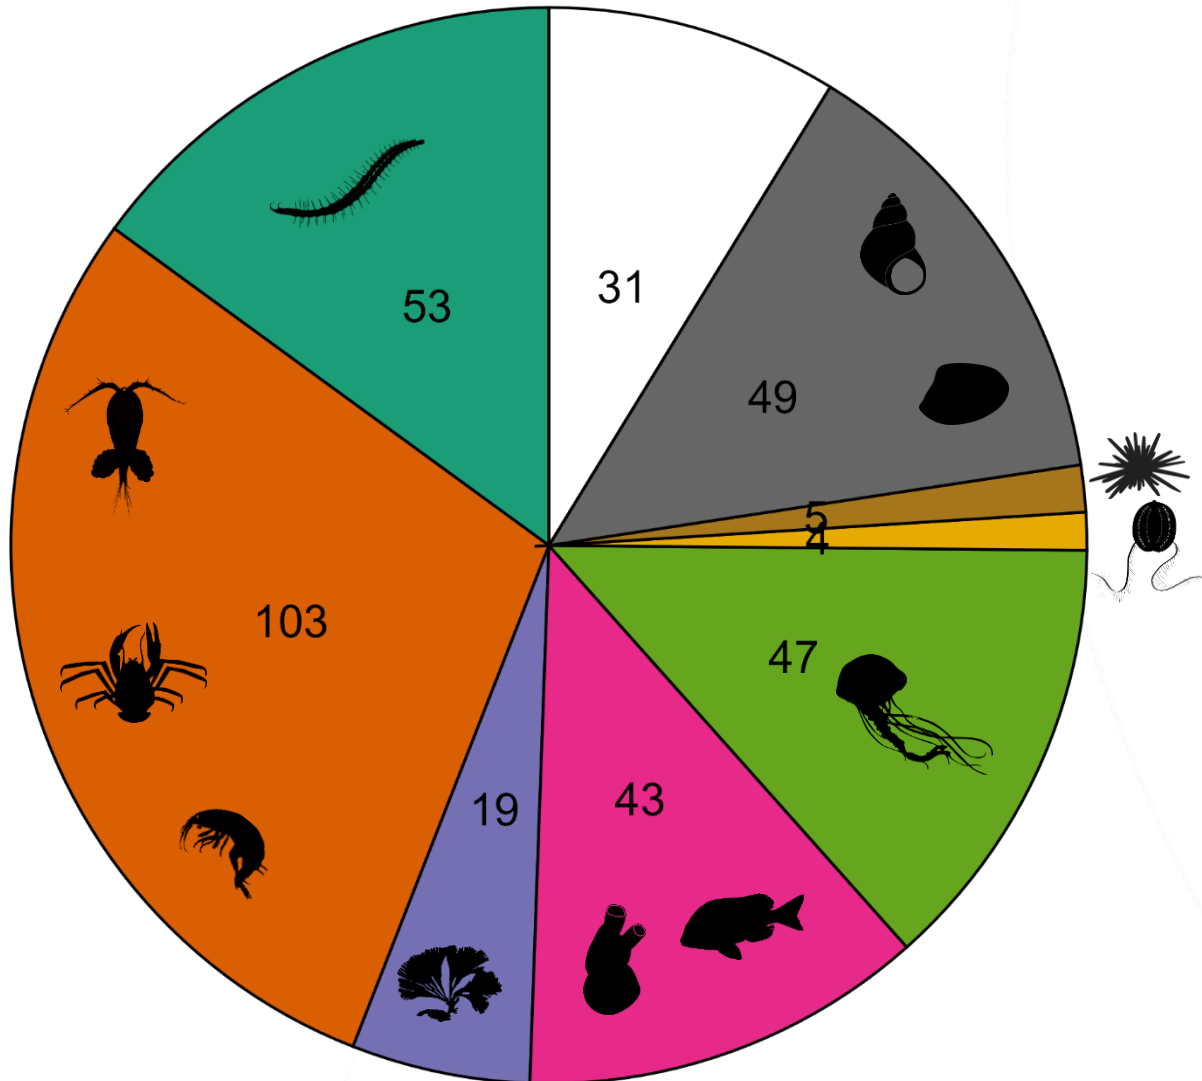

Phylum

- Annelida
- Arthropoda
- Bryozoa
- Chordata
- Cnidaria
- Ctenophora
- Echinodermata
- Mollusca
- other

277 species
15 phyla

- other : Gastrotricha: 2
- Nematoda: 8
- Nemertea: 5
- Platyhelminthes: 9
- Porifera: 1
- Rotifera: 1
- Xenacoelomorpha: 2

Detections eDNA + ZP net catches

Phylum

- Annelida
- Arthropoda
- Bryozoa
- Chordata
- Cnidaria
- Ctenophora
- Echinodermata
- Mollusca
- other

other:

- Entoprocta: 1
- Gastrotricha: 2
- Nematoda: 8
- Nemertea: 6
- Platyhelminthes: 9
- Porifera: 1
- Rotifera: 2
- Xenacoelomorpha: 2

354 species

16 phyla

→ ½ shared

Validation of metabarcoding

Are the detected species by metabarcoding known from the North Sea?

	total	Very likely	Likely	Unlikely
COI	269	238 (88.5 %)	20 (7.4 %)	11 (4.1 %)

Validation of metabarcoding

Are the detected species by metabarcoding known from the North Sea?

	total	Very likely	Likely	Unlikely
COI	269	238 (88.5 %)	20 (7.4 %)	11 (4.1 %)
18S V4	127	84 (63.0%)	20 (15.7 %)	23 (18.1 %)

congeneric species

Potentially new in German Seas?

- *Acartia (Acartiura) hudsonica*
North Sea: this study: eDNA & ZP, COI & 18S
Baltic Sea: study submitted

Re-discovered species

Dicoryne conferta
Hydrozoa
before 1950

Sagartia (Cylista) viduata
Anthozoa
before 1950

Megadrilus purpureus
Polychaeta
before 1900

Do we need replicates?

2x / day
over 9 days
→ **18** sampling events

6 replicates à 2 L/ sampling event

→ 108 filter replicates in total

(following results based on
COI only)

Do we need replicates: repetitive sampling

✓ Almost half of the species (44.7 %) was detected only during one or two sampling events

Do we need replicates: repetitive sampling

Core Community: 17 sp.

- 2 Annelida 
- 4 Arthropoda 
- 3 Bryozoa 
- 1 Chordata 
- 4 Cnidaria 
- 1 Echinodermata 
- 1 Mollusca 
- 1 Rotifera 

- ✓ Almost half of the species (44.7 %) was detected only during one or two sampling events
- ✓ 17 species ('Core Community') were always detected (ca. 9 %)

Summary

- YES - We are ready to use molecular identification methods to monitor North Sea zooplankton and marine fauna
- eDNA and zooplankton net catches identify slightly different communities:
 - **eDNA**
 - ++ benthic-associated taxa (i.e. polychaetes)
 - **ZP net catches**
 - ++ Arthropoda (i.e. holo- and meroplankton)
 - ++ identification of reproductive state based on mero- and ichthyoplankton
- Core community identified by low replication; comprehensive community identified by high replication
