Notes for Guidance

The North Pacific Marine Science Organization (PICES) announces its 2018 Annual Meeting to be held October 25 - November 4, 2018, at the Workpia Yokohama convention facility. The meeting is hosted by the Japanese government and in coordination with PICES Secretariat. Local arrangements are made by the City of Yokohama and the PICES-2018 local organization committee (LOC) comprised of Fisheries Agency and Japan Fisheries Research and Education Agency.

Presentations

In order to allow the sessions to run smoothly, and in fairness to other speakers, please note that all presentations are expected to adhere strictly to the time allocated. All authors should designate at least 5 minutes for questions. Authors can download their presentations directly to the computers where the session/workshops will be held.

Important: Please rename your files - time-name.ppt (e.g. 0900-Smith.ppt, 1530-Kim.ppt).

Posters

Posters for all sessions and workshops will be on display from the morning of Wednesday 31 October through the evening of Thursday, November 1, until the end of the Evening Poster Session/Reception.

Poster presenters are expected to be available near their posters to answer questions during the Thursday evening poster session, 18:00-21:00.

Location of the Poster Session: Marineria Room.

Internet access

Internet access via wireless LAN will be available in the main venue Workpia Yokohama and in the sub venue Yokohama Sanbo Hall (Marineria), where the poster session will be held

Social activities

Monday, October 29 (18:30-21:00)

Osanbashi Yokohama

Welcome Reception

The Welcome Reception for all participants (and registered guests)

Tuesday, October 30 (18:30-21:00)

TBA at the Meeting

Sport Event

Please sign up for participation at the Registration Desk

Thursday, November 1 (18:00-21:00)

Marineria Room

Wine & Cheese Poster Session Reception

The wine & cheese Poster Sessions at the meeting venue will allow participants to roam around the poster displays and chat with presenters while sipping beer or wine and nibbling on hot and cold hor d'oevres.

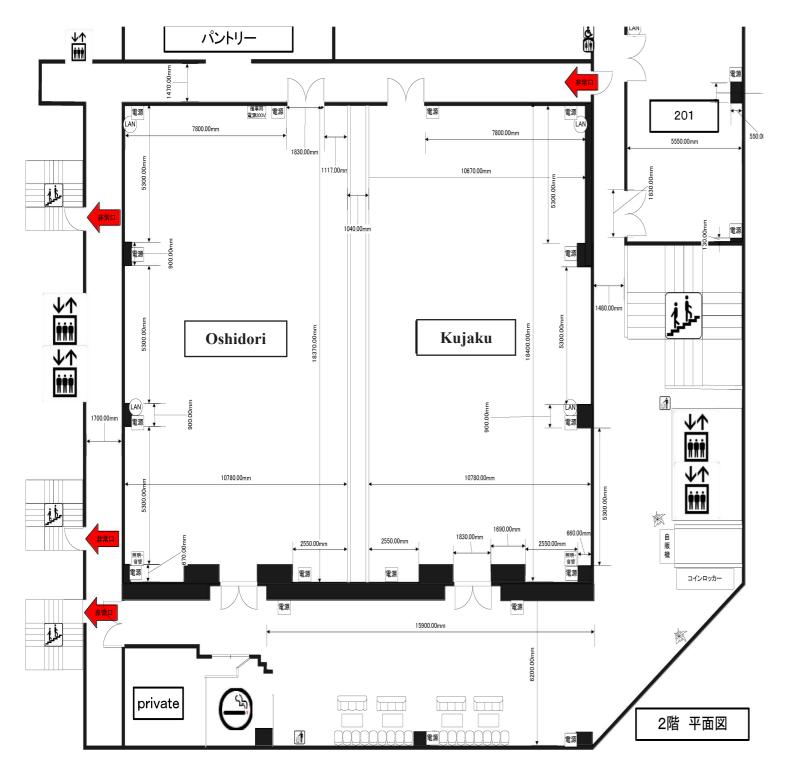

Posters must be removed at end of evening.

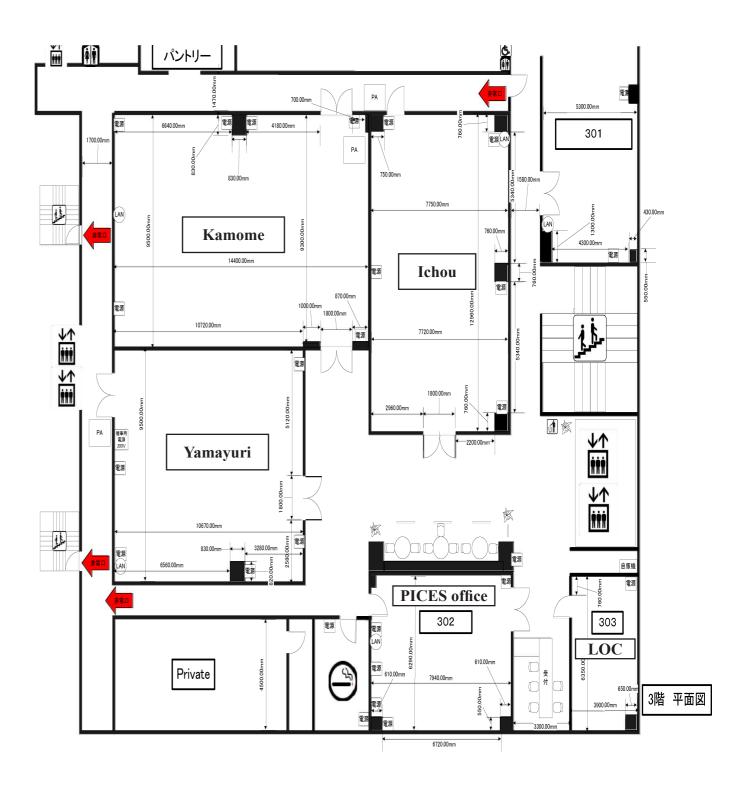

PICES Secretariat and Local Organizing Committee

are located in Room 302 and Room 303

List of Sessions and Workshops

S 1	Oct. 29-30	Toward integrated understanding of ecosystem variability in the North Pacific
S2	Nov. 1	Fish production through food web dynamics in the boundary current systems
S3	Nov. 1	Science communication for North Pacific marine science
S4	Oct. 30	Indicators for assessing and monitoring biodiversity of biogenic habitats
S5	Oct. 30	Seasonal to interannual variations of meso-/submeso-scale processes in the North Pacific
S6	Oct. 31	The FUTURE of PICES: Next steps in understanding, forecasting and communicating climate impacts on North Pacific marine ecosystems
S7	Oct. 30	Ecological responses to variable climate changes and their applicability to ecosystem predictions
S8	Nov. 1	Internal tides, nonlinear internal waves, and their impacts on biogeochemistry, climate and marine ecosystems via ocean turbulent mixing processes
S9	Oct. 30	Integration of science and policy for sustainable marine ecosystem services
S10	Nov. 1	Ocean acidification and deoxygenation and their impact on ocean ecosystems: Synthesis and next steps
S11	Nov. 1-2	Influence of climate and environmental variability on pelagic and forage species
S12	Oct. 30	Applying ecosystem considerations in science advice for managing highly migratory species
BIO-P	Nov. 2	Biological Oceanography Committee Paper Session
FIS-P	Nov. 2	Fisheries Science Committee Paper Session
HD-P	Nov. 2	Human Dimension Committee Paper Session
MEQ-P	Oct. 30, Nov. 1	Marine Environmental Quality Committee Paper Session
POC-P	Nov. 2	Physical Oceanography and Climate Committee Paper Session
W1	Oct. 25	Ecological roles of gelatinous zooplankton: Evaluation, integration and future prospects in a more gelatinous ocean
W2	Oct. 25	PICES contribution to Central Arctic Ocean (CAO) ecosystem assessment
W3	Oct. 25	Development of a systematic approach to data management in PICES
W4	Oct. 28	Synthesizing projected climate change impacts in the North Pacific
W5	Oct. 25	Identifying common reference points and leading indicators of ecosystem change
W6	Oct. 25	Regional evaluation of secondary production observations and application of methodology in the North Pacific
W 7	Oct. 25	Diets, consumption, and abundance of marine birds and mammals in the North Pacific
W8	Oct. 27	Taking Stock of Marine Ecosystem Services in the North Pacific – Exploring examples and examining methods

Session and Workshop Descriptions

S1: Science Board Symposium

Toward integrated understanding of ecosystem variability in the North Pacific

Convenors:

Hiroaki Saito (SB) *corresponding*, Se-Jong Ju (BIO), Xianshi Jin (FIS), Keith Criddle (HD), Chuanlin Huo (MEQ), Jennifer Boldt (MONITOR), Emanuele Di Lorenzo (POC), Joon-Soo Lee (TCODE), Steven Bograd (FUTURE), Sukyung Kang (FUTURE), Igor Shevchenko (Russia), Motomitsu Takahashi (Japan)

Invited Speakers:

Kirstin Holsman (NOAA Alaska Fisheries Research Center, Seattle, USA) Michio Kondoh (Tohoku University, Japan) Xiujuan Shan (Yellow Sea Fisheries Research Institute, CAFS, China)

The North Pacific marine ecosystem is an assemblage of many local marine ecosystems characterized by regional-specific environmental conditions and biological structures. The status of regional ecosystems is subject to the influence of local changes in various factors as well as interactions with adjacent local marine ecosystems and modifications by basin-scale processes. In recent decades, changes attributable to the influence of global warming have become more apparent, including extreme events in the atmosphere and the ocean that threaten marine ecosystems. Climate projections show monotonic increases in ocean warming and increased frequency of extreme events, such as marine heat waves. Measures to mitigate climate change and to achieve sustainable use of marine resources are integral to the Sustainable Development Goals adopted by the United Nations in 2015. Adaptation to present and anticipated marine ecosystem change is essential to enable humans to use ecosystem services in a sustainable manner. Consequently, policy makers need information about the status of regional marine ecosystems and forecasts of how they will change. Meeting that need requires information based on an integrated understanding of ecosystem variability in the North Pacific.

We encourage submission of papers on mechanisms of ecosystem responses to natural and anthropogenic forcing across the spectrum of time and space scales in the North Pacific, as well as monitoring, retrospective analysis, and forecasting ecosystem variability. In particular, papers that characterize variability in each regional ecosystem and link them to basin and global scales are welcome. Anticipated changes in North Pacific marine ecosystems include changing water temperature and upwelling intensity, increased occurrence of hypoxia, harmful algal blooms, and ocean acidification, as well as broader impacts from pollutants and contaminants, coastal development, and fishing. In addition, papers are encouraged on strategic options to forestall, mitigate, or adapt to ecosystem change. Examination of interactions among regional marine ecosystems and relationships between regional and basin-scale ecosystem variability will provide an improved understanding of marine ecosystem structure and function in the North Pacific in the face of climate change.

S2: FIS/BIO Topic Session

Fish production through food web dynamics in the boundary current systems

Convenors:

Motomitsu Takahashi (Japan) corresponding, Yuji Okazaki (Japan), Ryan Rykaczewski (USA), Akash Sastri (Canada)

Invited Speaker:

Chih-hao (Zac) Hsieh

Trophic interactions from nutrient to fish are variable spatially and temporally in the North Pacific ecosystems. Fish production has been recognized generally as the grazing food chain: diatom-calanoid copepod-fish. In addition, microbial food chain and jelly-associated chain also work for maintaining biological production. Comparative studies on trophic interactions between the western boundary current (Kuroshio and Kuroshio Extension) and the eastern boundary current (California Current) would reveal biogeochemical characteristics in the North Pacific marine ecosystems. This session aims to reveal trophic interactions through nutrient supply to fish production and to compare the structures and function between the different boundary systems in the North Pacific. Interaction examples of nutrient supply, community structures of phyto- and zooplankton, food availability for fish larvae and the synergistic model in the ecosystem are highly encouraged. We also seek presentations on trophic interactions revealed using not only traditional approaches based on observations but also contemporary approaches including stable isotopes and DNA bar-coding analyses.

S3: FUTURE Topic Session Science communication for North Pacific marine science

Convenors:

Toyomitsu Horii (Japan), (MEQ / FUTURE SSC), *corresponding*, Ekaterina Kurilova (Russia), (HD), Mitsutaku Makino (Japan), (HD / FUTURE SSC), Jackie King (Canada), (FIS, FUTURE SSC, S-CCME)

Invited Speaker:

Alan Haynie (Alaska Fisheries Science Center, National Marine Fisheries Service, USA)

Science communication between researchers and society is increasing in importance for PICES' integrated marine science. For example, natural scientific information about sustainable uses of ecosystems cannot be meaningful if the social and economic expectations of the users are not considered. The goal of ecosystem conservation activities, or sustaining "a good ecosystem", cannot be decided without deliberate discussions that include society. In addition, each country or society has a specific view of "a good ecosystem" which could benefit from largerscale coordination and comparison within the North Pacific basin. Conducting multi-disciplinary integrated marine ecosystem studies, such as those supporting the FUTURE Science Program, requires close and effective interaction of concepts, methodologies, models, and data, from various disciplines. Dissemination of that complex scientific information to society can be difficult. The PICES' scientific community would benefit from hearing examples of successful scientific communication. An example of communication to society includes providing scientific information about the fish stock sustainability and is often used by fish consumers with impacts on market demand which can ultimately decide the fishing pressure on the marine resources. A better understanding by stakeholders of the scenarios of future ecosystem states is an important step towards a society resilient and adaptable to global changes. This Topic Session invites studies about science communications such as those above. Theoretical studies, case studies, experiences, and perspectives for better science communication for the PICES activities are encouraged.

S4: BIO Topic Session Indicators for assessing and monitoring biodiversity of biogenic habitats

Convenors:

Anya Dunham (Canada) corresponding, Hye-Won Moon (Korea)

Invited Speakers:

Yves-Marie Bozec (The University of Queensland, Australia)

Biogenic habitats formed by corals, sponges, and other structure-forming taxa support high species abundance and biodiversity, including socio-economically important fishes and invertebrates. These habitats are also known to be vulnerable to disturbances from human impacts and climate change. Predicting, assessing, and monitoring shifts in habitat-forming species and associated communities in response to natural and anthropogenic forcing require suites of measurable indicators. The goal of this session is to improve our understanding of ecologically relevant, sensitive, observation-based indicators for assessing and monitoring biogenic habitats. We invite presentations on indicators encompassing single or compound metrics of the marine biota in a broad sense (from physiological to species, community and habitat levels) which could be measured to indicate the condition of biogenic habitats and monitor changes to the habitats and communities they support. Empirical studies and literature reviews on indicator development, assessment, and/or application are invited. WG-32 members and collaborators will present a literature review of documented functional associations between commercially important fish and invertebrate species and biogenic habitats and address methods to incorporate these associations into indicator development. This session will help improve our understanding and ability to identify and characterize changes in biogenic habitats, as well as their recovery potential. The results of this session will help inform management and policy decisions and marine spatial planning processes that can maintain ecosystem biodiversity, structure, and function.

S5: POC Topic Session

Seasonal to interannual variations of meso-scale processes in the North Pacific

Co-sponsor: OMIX

Convenors:

Annalisa Bracco (USA) corresponding, Sachihiko Itoh (Japan), Elena Ustinova (Russia)

Invited Speakers:

Yu-Lin Eda Chang (Japan Agency for Marine-Earth Science and Technology, JAMSTEC) Bo Qiu (Department of Oceanography, University of Hawaii at Manoa)

Recent observations and model simulations suggest that the ocean currents and biogeochemistry at and near the ocean surface undergo prominent seasonal variability at the submesoscales (scales of 0.1–10 km). The submesoscale seasonal variability is a function of the ratio of lateral to vertical density gradients and, in the open ocean, depends primarily on the mesoscale activity of the flow. Consequently, in the open ocean numerous submesoscale cyclonic eddies can form in winter and the vorticity distributions are skewed towards positive values typical of cyclonic structures. This skewness is highly reduced from spring to fall. In coastal areas, on the other hand, density gradients can be forced not only by mesoscale circulations but also by freshwater fluxes from rivers or melting glaciers, resulting in a seasonal cycle that may differ significantly from region to region, and in interannual variability controlled in part by hydrological and cryospheric processes. Implications of such variability for the ocean biogeochemistry and nutrient distributions are poorly understood. This session aims at characterizing the variability of mesoscale and submesoscale circulations and its linkages with the marine ecosystem in the PICES region at seasonal-to-interannual scales. We welcome as well contributions about future changes in mesoscale variability or in mixed-layer depth and its buoyancy, and therefore in submesoscale variability, in warming climate scenarios.

S6: FUTURE Topic Session

The FUTURE of PICES: Next steps in understanding, forecasting and communicating climate impacts on North Pacific marine ecosystems

Convenors

Sukyung Kang (Korea) corresponding, Steven Bograd (USA)

'Forecasting and Understanding Trends, Uncertainty and Responses of North Pacific Marine Ecosystems' (FUTURE) is the flagship integrative Scientific Program undertaken by the member nations and affiliates of PICES. Since its inception in 2009, FUTURE has contributed to guiding PICES science to understand how marine ecosystems in the North Pacific respond to climate change and human activities, to forecast ecosystem status based on a contemporary understanding of how nature functions, and to communicate new insights to its members, governments, stakeholders and the public. FUTURE is scheduled to conclude in 2019, so this is a good time to reflect on its accomplishments, to identify remaining gaps in fulfilling its research objectives, and to contemplate new directions for PICES science. In this session, we will conduct a FUTURE 'Mini-Symposium' to update the PICES community on FUTURE progress and to coordinate activities amongst the PICES Expert Groups. Each Expert Group will provide a brief review of their past, current and planned activities as they relate to the FUTURE Science Program, which will be followed by a plenary discussion on the future path of PICES science in the coming years.

S7: POC/FUTURE Topic Session

Ecological responses to variable climate changes and their applicability to ecosystem predictions

Endorsed by CLIVAR

Convenors:

Ryan Rykaczewski (USA) corresponding, Akinori Takasuka (Japan), Chan Joo Jang (Korea)

Invited Speaker:

Susan Allen (University of British Columbia (UBC), Canada)

In the North Pacific, regional and large-scale climate forcing impacts a range of physical and ecological characteristics including temperature, stratification, ocean circulation, upwelling, biogeochemical properties, and primary and secondary production. These characteristics, in turn, can impact the distribution, composition, and productivity of fisheries resources. However, the accuracy of many climate-ecosystem relationships derived from historical observations deteriorates when faced with new observations. Reducing the uncertainty associated with climate-ecological relationships requires an understanding of the mechanisms that govern empirical correlations. In this session, we seek presentations focused on climate-ecosystem relationships and whether such relationships can be expected to persist under future (e.g., months to decades) climate conditions. Many regional and large-scale properties of the physical ocean state can be skillfully predicted over scales of seasons (and years for some properties), and we hope that such ability, with further clarification of predictable properties in different regions on different timescales, can be used in combination with understanding of robust climate-ecosystem relationships to provide forecasts of marine ecosystems that will be useful to resource management and utilization.

S8: POC/FUTURE/MONITOR Topic Session

Internal tides, nonlinear internal waves, and their impacts on biogeochemistry, climate and marine ecosystems via ocean turbulent mixing processes

Co-sponsor: OMIX

Convenors

Shin-ichi Ito (Japan) corresponding, SungHyun Nam (Korea), John Barth (USA), Annalisa Bracco (USA)

Invited Speakers:

Kristen Davis (University of California, USA) Yign Noh (Yonsei University, Korea) Ichiro Yasuda (The University of Tokyo, Japan)

Mixing in the ocean occurs over a broad range of scales and plays a major role in the exchanges of water, nutrients, carbon and heat, thus controlling ocean biogeochemistry and climate. Ocean turbulent mixing is often associated with internal tides and nonlinear internal waves, however the internal wave generation, propagation, and dissipation mechanisms in most of the North Pacific are not well understood due to limited observations and model capabilities. Intense ocean mixing generally occurs in presence of tidal movements around rough bottom topography such as that found on continental shelves, in straits, atop ocean ridges, and around island chains. Strong internal tides and nonlinear internal waves are commonly found in the North Pacific, particularly in shallow seas, outer and inner shelves, and nearshore zones. Recently, a periodic fluctuation of seawater properties, nutrients and oxygen concentrations synchronous with the 18.6-year nodal tide has been observed in the subarctic and subtropical oceans in the North Pacific. Some studies have suggested that the 18.6-year nodal tide might regulate a basin wide climate mode in the North Pacific that has the potential to accelerate or decelerate climate warming depending on the phase. Given the key role played by ocean mixing in controlling biogeochemical interactions and global climate variability, it is our urgent task to elucidate mechanisms of ocean turbulent mixing processes and its impacts.

We propose a topic session that involves participation from multiple PICES committees and focuses on internal tides, nonlinear internal waves, ocean mixing processes, and their impacts on biogeochemistry, climate and marine ecosystems. Specifically, we would welcome presentations on topics such as (a) observational and numerical approaches to understand internal tides, nonlinear internal waves, ocean mixing processes and their distribution, (b) turbulent mixing impacts on biogeochemistry, climate and marine ecosystems, (c) future projections of North Pacific considering 18.6-year nodal tide.

S9: HD Topic Session

Integration of science and policy for sustainable marine ecosystem services

Convenors:

Shang Chen (China) corresponding, Daniel K. Lew (USA), Jungho Nam (Korea)

The provisioning, cultural, regulating and supporting services are the major benefits people obtain from the coastal and marine ecosystems. The identification, quantification, valuation and management of ecosystem services are key scientific questions, and have attracted more concerns from both the major intergovernmental organizations (such as PICES, ICES, IMBeR, IPBES) and the environmental organizations (such as WWF, TNC, ESP). The goals of this session are: (1) to provide a venue for marine scientists and social scientists to exchange results from research on identification, quantification, valuation and management of ecosystem services, and (2) to provide a platform to share and discuss the integration of ecosystem service science into policy-making of marine affairs. This session will continue providing strong support to the TORs of HD committee and contribute a greater understanding of social and economic status of the North Pacific ecosystem and fill the gaps to achieve the FUTURE Objectives.

S10: POC/BIO Topic Session

Ocean acidification and deoxygenation and their impact on ocean ecosystems: Synthesis and next steps

Co-sponsor: ICES

Convenors:

Tsuneo Ono (Japan) corresponding, Jim Christian (Canada), Silvana Birchenough (ICES)

Invited Speakers:

Christopher Harley (Department of Zoology, University of British Columbia, Canada) Shoshiro Minobe (Faculty of Science, Hokkaido University, Japan)

Studies of ocean acidification (OA) are showing progress, in particular, monitoring of oceanic acidification status (ca. pH, pCO2 and Ω aragonite, Ω calcite) in the various PICES countries has significantly progressed in recent years. Progress has also been achieved in the field of biological OA impact. The importance of interactions with other stressors (temperature, deoxygenation, etc.), interspecific interaction (e.g., OA effects on prey species), and biological ability to adapt to OA stress, are increasingly recognized. We welcome presentations from the fields of OA monitoring and impact experiments, to construct new perspective on present OA status in the North Pacific. Presentations on future projections are also welcome. We also welcome presentations about plans for further progress in our understanding, such as continuous carbon system monitoring by new technologies, new experimental studies for OA adaptation, and field observation of biological responses to existing OA and deoxygenation events.

S11: MONITOR Topic Session

Influence of climate and environmental variability on pelagic and forage species

Convenors:

Matthew Baker (USA) corresponding, Sei-Ichi Saitoh (Japan), Mary Hunsicker (USA), Elizabeth (Ebett) Siddon (USA)

Invited Speaker:

Haruka Nishikawa (Japan Agency for Marine-Earth Science and Technology, Japan)

Climate and environmental variability have profound effects on pelagic ecosystems from zooplankton to fish and invertebrate stocks. The dynamics of fish species within the pelagic environment may be particularly responsive to environmental drivers, including temperature and salinity, as well as biological drivers, such as prey production and phenology. In addition, differential species responses to environmental and biological drivers may alter fish condition and interactions. Understanding the mechanisms that drive pelagic fish dynamics is important for estimating fish survival and recruitment. This session aims to integrate research that elucidates mechanisms linking climate with recruitment, survival and condition of forage species, larval and juvenile pelagic stages of ground fish, and pelagic fishes more generally. Papers are encouraged in a wide range of topics relevant to environmental and biological conditions and pelagic species or stages, particularly those in the following areas: biophysical interactions; recruitment fluctuations in response to climate and environmental conditions; shifts in species dynamics, distribution and behavior related to environmental forcing; research on critical life history stages in the pelagic environment; and modeling approaches to improve understanding of environmental effects using climate hindcasts and time series analyses and/or forward projections and climate forecasts.

S12: FIS Topic Session

Applying ecosystem considerations in science advice for managing highly migratory species

Co-sponsor: ISC

Convenors:

Steve Teo (ISC USA) corresponding, Carolina Minte-Vera (IATTC), Gerard DiNardo (USA)

Invited Speaker:

Yong Chen (School of Marine Sciences, University of Maine, USA)

This topic session will be convened by WG-34: Joint PICES-ISC Working Group on Oceanographic Conditions and the Distribution and Productivity of Highly Migratory Fish. Large-scale oceanographic processes and bioenergetic requirements determine the distribution and productivity of many pelagic fish populations in the North Pacific. For example, highly migratory species (HMS), such as albacore tuna (*Thunnus alalungus*) and Pacific sardine (Sardinops sagax), have environmental thresholds and preferences, as well as energetic requirements to sustain growth and survival that drive their distribution and productivity. Managing HMS has traditionally focused on maintaining the sustainability of targeted stocks and, as such, comprehensive data sets on the catches, biology and ecology of many exploited stocks exists. In many cases, there are limited quantitative data describing ecosystem impacts on HMS, social and economic impacts on HMS fisheries due to ecosystem variability, and limited formal consideration of the roles of external drivers (e.g., oceanographic variability) in the context of sustainability and governance. Beyond these limitations there is also the challenge to identify linkages and important relationships both within ecosystems (including exploited stocks), and across social, economic and governance facets of fisheries management. This workshop will provide an overview of contemporary research on the topic, including the identification of statistical modeling approaches that link spatially explicit environmental data (e.g., satellite derived SST) to distributional fish data (e.g., fishery-dependent and fishery-independent), methods to assess impacts of oceanographic variability on fish productivity and socioeconomic decision making, methodologies that explicitly incorporate environmentally driven dynamics into HMS stock assessments, and challenges facing governance when applying ecosystem considerations. Group discussion will help facilitate identification by the Joint Working Group of suitable methodologies for advancing fish stock assessment procedures and methodologies, as well as strategies for applying ecosystem considerations to HMS management.

BIO Contributed Paper Session

Convenors:

Se-Jong Ju (Korea), Debora Iglesias-Rodriguez (USA)

The Biological Oceanography Committee (BIO) has a wide range of interests spanning from molecular to global scales. BIO targets all organisms living in the marine environment including bacteria, phytoplankton, zooplankton, micronekton, benthos and marine birds and mammals. In this session, we welcome all papers on biological aspects of marine science in the PICES region. Contributions from early career scientists are especially encouraged.

FIS Contributed Paper Session

Convenors:

Xianshi Jin (China), Jackie King (Canada)

This session invites papers addressing general topics in fishery science and fisheries oceanography in the North Pacific and its marginal seas, except those covered by Topic Sessions sponsored by the Fishery Science Committee (FIS).

HD Contributed Paper Session

Convenors:

Keith R. Criddle (USA), Mitsutaku Makino (Japan)

This session invites papers addressing the promotion, coordination, integration and synthesis of research activities related to the contribution of the social sciences to marine science, and to facilitate discussion among researchers from both the natural and social sciences. We invite abstract submissions on any of these topics.

MEQ Contributed Paper Session

Convenors:

Chuanlin Huo (China), Thomas Therriault (Canada)

Papers are invited on all aspects of marine environmental quality research in the North Pacific and its marginal seas, except those covered by Topic Sessions sponsored by the Marine Environmental Quality Committee (MEQ).

POC Contributed Paper Session

Convenors

Emanuele Di Lorenzo (USA), Yury I. Zuenko (Russia)

Papers are invited on all aspects of physical oceanography and climate in the North Pacific and its marginal seas, except those covered by Topic Sessions sponsored by the Physical Oceanography and Climate Committee (POC).

GP: General Poster Session

Papers that do not fit any other topic sessions / workshops.

W1: BIO Workshop

Ecological roles of gelatinous zooplankton: Evaluation, integration and future prospects in a more gelatinous ocean

Convenors:

Shin-ichi Uye (Japan) corresponding, Chaolun Li (China), Brian Hunt (Canada), Richard Brodeur (USA)

Invited Speakers:

Russell Hopcroft (University of Alaska Fairbanks, USA)

Dhugal Lindsay (Japan Agency for Marine-Earth Science & Technology (JAMSTEC))

Gelatinous zooplankton, consisting of taxonomically diverse groups such as cnidarians, ctenophores and pelagic tunicates, represent a conspicuous component of the zooplankton communities throughout the pelagic zone. Owing to their characteristic reproductive methods and high somatic growth rates, they can rapidly build a large population biomass, as typically demonstrated by recurrent blooms of cnidarian jellyfish (e.g. Aurelia, Chrysaora and Nemopilema) in the PICES region. Recent studies on their biology and ecology, particularly to elucidate the mechanisms of their problematic blooms, have enhanced our knowledge, yet there is still a large gap in understanding potential ecological roles of gelatinous zooplankton in pelagic ecosystems. Although it is inherently difficult to determine their biomass, spatio-temporal distributions and physiological rates, they may play important roles in transferring materials and energy from picoplankton and zooplankton up to commercially-important fish and other top trophic levels. This workshop seeks contemporary studies on gelatinous zooplankton to evaluate their functional roles. We invite contributions on diverse taxonomic groups and from diverse ecosystems. Studies using new technologies, such as acoustic and optical instruments, remotely-operated and autonomous vehicles, biochemical markers, and molecular approaches, are encouraged. We will discuss future trends of gelatinous zooplankton in the North Pacific region under observed and predicted environmental changes in the context of their ecological roles, and hope to facilitate international research collaborations on gelatinous zooplankton in the North Pacific and elsewhere.

W2: MONITOR/FIS Workshop PICES contribution to Central Arctic Ocean (CAO) ecosystem assessment (Second)

Convenors

Sei-Ichi Saitoh (Japan) corresponding, Hyoung Chul Shin (Korea), Lisa Eisner (USA), Gordon Kruse (USA)

Invited Speaker:

Hein Rune Skjoldal (Institute of Marine Research, Norway)

The Central Arctic Ocean (CAO) is in rapid transition, largely driven by North Pacific change, has become accessible to a range of activities. Rapid loss of sea ice cover has opened up the Central Arctic Ocean (CAO) for potential fishing opportunities. Debate and policy initiatives have been launched for regulating fisheries that are anticipated to begin in the CAO. Scientific research in the CAO, however, remains scarce in contrast to an abundance of research in the neighboring North Pacific. To inform and support policy decisions in the CAO, an integrated ecosystem assessment is the foremost task. PICES joined with ICES and PAME for such an assessment by forming WG 39 with its mission period ending 2018. WG 39, despite its late start, intends to provide significant Pacific input for the assessment at the third meeting of the Joint Group in May 2018, and also to the final report expected toward the end of 2018. We propose two workshops in 2018. The first one, which is technical in nature and for experts, will be organized February/March in 2018 and this is mostly in preparation for the third meeting of the Joint Group. As a follow-up to this, a half day workshop is proposed to take place at PICES-2018 to consolidate our findings and advice, connect it to those from ICES and to report to the wider PICES community. The major theses of the second workshop at PICES-2018 will be; key locations in the Pacific Arctic and the critical processes to determine biological production; characterization of major changes for recent decades; ramifications for ecosystem monitoring and management in the region. One of the tasks for WG 39 in doing this will be to explore for and make use of a pool of databases, aided by the general findings of previous reports and literature survey.

W3: TCODE Workshop

Development of a systematic approach to data management in PICES

Convenors:

Joon-Soo Lee (Korea) corresponding, Peter Chandler (Canada), Igor Shevchenko (Russia)

Invited Speakers:

Yutaka Michida (Atmosphere and Ocean Research Institute, The University of Tokyo, Japan)

Since its establishment in 1992, PICES has produced observation data, experimental data, and model data for scientific purposes through expert group activities and projects, and analyzed the results to produce papers, reports, and data products. Some of the data are also available online. However, PICES data and data products have not been systematically managed and are expected to increase more and more in an unmanaged status in the future. In this regard, there is an urgent need to discuss how to manage the current PICES data and data products as well as how to manage them in the future. Therefore, this workshop aims to identify problems in the sustainable management and use of PICES data and data products, to seek better management structure and system, and to improve the linkage among PICES data producers, scientists and data managers.

W4: POC/FIS/BIO Workshop

Synthesizing projected climate change impacts in the North Pacific

Co-sponsor: ICES

Convenors:

Anne Hollowed (USA) corresponding, Shin-ichi Ito (Japan), Jacquelynne King (Canada), Myron Peck (ICES)

Invited Speakers:

William Cheung (The University of British Columbia, Canada)

Taketo Hashioka (Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

Scientists have endeavored to project the implications of climate change on marine ecosystems throughout the North Pacific. We expect that many researchers will complete these projections by June 2018 in anticipation of the 4th Effects of Climate Change on the World's Oceans symposium. A workshop is needed to compare and synthesize results from this international projection modeling effort. The workshop will provide a forum for discussions of: a) Projection outcomes under different modeling approaches; b) Opportunities for comparative studies looking at projected impacts on selected species or fisheries in different LMEs; c) How modeling teams addressed the uncertainty landscape including issues of scenario, parameter and model uncertainty; and d) The range of potential harvest strategies selected and their performance relative to different national value systems. We anticipate that a manuscript will be generated from this session that will be submitted to a peer reviewed journal.

W5: FUTURE Workshop

Identifying common reference points and leading indicators of ecosystem change

Convenors

Mary Hunsicker (USA) corresponding, Xiujuan Shan (China), Vladimir Kulik (Russia)

Invited Speaker:

Caihong Fu (DFO, Canada)

Abrupt nonlinear change in ecosystem structure and function can dramatically alter human-derived benefits from the system and can have negative impacts on people's livelihoods and well-being. A growing number of driver-response relationships in marine ecosystems are being identified as strongly nonlinear, indicating that they are potentially prone to inflection points and threshold dynamics. Better knowledge of where such thresholds occur can advance our ability to anticipate future conditions and critically inform what management actions can maximize ecological, social or economic benefits. Moreover, thresholds common across analogous systems can be used to develop robust sets of reference points to prevent ecosystem components from tipping into undesirable

states. A major goal of WG-36 CERP is to 'determine shapes or functional forms of driver - response relationships from available datasets, and quantify thresholds to identify potential ecosystem reference points' in North Pacific ecosystems (TOR 4). The proposed workshop is an important step for completing this goal and for making comparisons among the focal ecosystems selected for WG-36 activities. The workshop will also allow WG-36 to make progress in 'identifying ecosystem components that respond earliest to changes in biophysical drivers and could potentially serve as leading indicators of loss of resilience and ecosystem change' (TOR 5). In addition, the proposed workshop will give WG-36 members an opportunity to work together to ensure that the methods and R code generated for the WG activities can be easily used by PICES member nations as well as other nations to identify potential target or limit reference points and early warning signs of ecosystem change. The specific objectives of the workshop are to: 1) Conduct analyses for TOR 4 to 'determine shapes or functional forms of driver-response relationships from available datasets, and quantify thresholds to identify potential ecosystem reference points' in North Pacific ecosystems. 2) Identify differences and commonalities among thresholds / ecosystem reference points in the focal ecosystems of WG-36 activities. 3) Select common methods for systemwide comparisons to identify leading indicators of ecosystem 4) Develop, test and share R code via shared GitHub repository that is generalizable for other ecosystems. 5) If time allows, begin applying leading indicator analyses to focal ecosystems of PICES member nations (TOR 5).

W6: BIO Workshop

Regional evaluation of secondary production observations and application of methodology in the North Pacific

Convenors:

Akash Sastri (Canada) corresponding, Toru Kobari (Japan)

Invited Speaker:

Koichi Ara (Nihon University, Japan)

Zooplankton production represents a quantitative proxy for the functional response of marine ecosystems to regional and global climate change, because material and energy scattering in the lower food web is integrated by zooplankton communities. Although a variety of methodologies for measuring zooplankton production have been developed and applied over the last half century, our knowledge of which approaches are applicable to a diverse range of organisms and habitats remains limited. Recent advances in biochemical methods for measuring zooplankton production have been reviewed, however, such information is still lacking for the traditional methodologies. This workshop will share the current status on zooplankton production methodologies and measurements, to be reported by the working group members representative of each PICES nation. In addition, we also encourage presentations and discussion on advantages, applications and limitations of traditional methodologies on zooplankton production applicable to natural zooplankton populations and communities.

W7: BIO Workshop

Diets, consumption, and abundance of marine birds and mammals in the North Pacific

Convenors:

Andrew Trites (Canada) corresponding, Tsutomu Tamura (Japan), Yutaka Watanuki (Japan), Robert Suryan (USA)

Invited Speaker:

Andrew Trites (The University of British Columbia (UBC), Vancouver, Canada)

The S-MBM of BIO is midway through a 5-year program to update the 2000 PICES Scientific Report on Predation by Marine Birds and Mammals in the Subarctic North Pacific Ocean. To date, we have held a successful workshop (2016) to frame the program and agree on general modelling approaches, spatial boundaries, time scales and other considerations (see PICES W6 Workshop Report: Consumption of North Pacific forage species by marine birds and mammals). Since our 2016 workshop, we initiated the agreed upon databases to estimate prey consumption, and will continue to add and verify data over the coming 12 months in anticipation of our workshop, when invited experts will review the compiled information. Obtaining this expert consensus on model input parameters through the proposed workshop process is a necessary and critical next step to ensure the success of our program to estimate the amounts of prey consumed by seabirds and marine mammals in the North Pacific. The workshop

participants will advance finalizing our databases of diets, abundances, distributions, and energy requirements of 135 species of seabirds, and all 47 species of marine mammals in the 12 PICES eco-regions. During the workshop, the invited holders of data and knowledge on the feeding ecology of seabirds and marine mammals in the North Pacific will 1) review the data summaries compiled by S-MBM members, 2) identify data gaps and sources of missing information, and 3) assist in framing appropriate educated guesses on possible values for missing data. The workshop will be structured with two breakout groups (birds and mammals), where data are presented by individual species and consensus is obtained on their accuracy and completeness. This process will result in near-complete databases of diets, abundances, and energy requirements of marine birds and mammals in the North Pacific.

W8: HD Workshop

Taking stock of Marine Ecosystem Services in the North Pacific - Exploring examples and examining methods

Convenors:

Shang Chen (China) corresponding, Daniel K. Lew (USA)

This workshop will advance understanding of the character and value of marine ecosystem services under the aegis of the PICES Working Group on Marine Ecosystem Services (WG-MES/WG 41). Members of WG-MES will be invited to attend this workshop, but attendance will be open to encourage participation by local scientists. The main tasks of this workshop include: (1) reviewing MES studies from the North Pacific region; (2) identifying gaps in understanding the status and trends of MES in North Pacific region; (3) developing a draft typology of marine ecosystem services and various approaches and methods for assessing those services and their value.

Integrated understanding of warming in the western North Pacific

Tomowo Watanabe

28

Japan Sea National Fisheries Research Institute (JSNFRI), Japan Fisheries Research and Education Agency (FRA)

Further advancement of climate warming and increase in the occurrences of extreme phenomena are predicted by global warming simulations. Measures against these changes are included as important in the Sustainable Development Goals (SDGs). PICES has promoted marine ecosystem research related to climate change in the North Pacific and has provided a lot of scientific information contributing sustainable development of fisheries. For SDGs, preparation of the accessible scientific information for users of marine ecosystem services is needed in conjunction with further promotion of research on various field of marine science. Because the western North Pacific and its marginal seas are among the hot spots strongly affected by global warming, practical information for adaptation based on scientific knowledge about the marine ecosystems is required for sustainable development of fisheries. Moreover, the prediction with higher resolution is indispensable for adaptation of fisheries in the western North Pacific. It is important for improvement of the prediction of the effects of global warming to understand the current situation based on monitoring and to revisit the knowledge on marine ecosystems. In the western North Pacific, systematic monitoring research on marine environment and marine organisms was started at the beginning of the 20th century, and the data accumulated over 100 years or more are important for understanding the trend and the variability of the marine ecosystems.

Warming is the main climate change observed in the coastal area of the western North Pacific from the late 19th century until date. The climate shifts indicating the rapid change between the climate states contribute to the warming and the shifts in the late 1940s and in the late 1980s were significant in the area. Warming of the sea surface related to these climate shifts is more apparent in the area from the coast of the Asian continent to the western boundary current region in the mid-latitude zone. Many studies have been conducted on the changes in marine environment and marine organisms related to the climate shifts based on the monitoring data, and the understanding of the effects of climate warming has been advanced. Evidently, the effect of climate warming on marine ecosystems in the area is the northward expansion of marine organisms from subtropical waters. The local ecosystems along the warm currents have been affected directly by the increase in water temperature and by the increase in subtropical fish species. It appeared that the adaptations of marine ecosystems to the average physical state after the shift in the late 1980s are still in progress in both coastal and offshore area. Therefore, sustainable monitoring and integrated evaluation of marine ecosystems in wider area from the subtropical waters to the subarctic waters in the western North Pacific is important for providing practical information about the adaptation of coastal fisheries and offshore fisheries.

POSTER SESSION October 31– November 1

(*) Identifies an Early Career Scientist

S1: Toward integrated understanding of ecosystem variability in the North Pacific

S1-P1 Lev B. Looney*

The decomposition of wind-forced upwelling variability in the California Current though the

application of cyclostationary empirical orthogonal functions

S1-P2 Joanne Breckenridge*

The importance of peak river flow timing to copepod abundance in the Fraser River Estuary,

Canada

S1-P3 Sanae Chiba

(cancelled) Observing ecosystem variability in the UN Decade of Ocean Science: OceanObs'19

perspective

S1-P4 Ferdenant A. Mkrtchyan

(cancelled) Capabilities of remote monitoring systems for assessing the state of marine ecosystems

S1-P5 Ferdenant A. Mkrtchyan

(cancelled) About an adaptive optical technology for monitoring aquatic ecosystem

S1-P6 So Jin Kim*

Newly discovered role of heterotrophic nanoflagellate Katablepharis japonica, a predator of

toxic or harmful dinoflagellates and raphidophytes and its interactions with common

heterotrophic protists

S1-P7 Hae Jin Jeong

Ichthyotoxic Cochlodinium polykrikoides red tides offshore in the South Sea, Korea in 2014:

Temporal variations in three-dimensional distributions of red-tide organisms and

environmental factors

S1-P8 Qun Lin

Effects of fishing and environmental changes on the ecosystem of the Bohai Sea

S1-P9 Jennifer L. Boldt

Fish condition and implications for recruitment in the Northeast Pacific

S2: Fish production through food web dynamics in the boundary current systems

S2-P1 Kanako Saito and Toru Kobari

Trophic sources and links of mesozooplankton and fish larvae in the Kuroshio based on stable

isotope ratios

S2-P2 Ibuki Sato and Toru Kobari

Trophic sources and linkages of mesozooplankton and fish larvae in the Kuroshio based on

metabarcoding analysis

S2-P3 Fukutaro Karu*

Mesozooplankton feeding on phytoplankton and protozoans in the Kuroshio

S2-P4 Takeru Kanayama*

Impact of microzooplankton grazing on phytoplankton community in the Kuroshio: A major

trophic pathway of plankton food web

S2-P5 **Ying Xue**

(cancelled) Using topological network to identify keystone species in the food web of Haizhou Bay, China

Poster presenters are expected to be available near their poster to answer questions during the Thursday (November 1) evening poster session.

S2-P6 Kei Nakaya

The influence of sporadic oceanic water inflow into Kagoshima Bay, southern Japan on larval

fish assemblage

S2-P7 Hiroumi Kuroda

Feeding habits of larval fish in the mouth of Kagoshima Bay, southern Japan

S2-P8 Shohei Yoshinag

The assemblages and feeding habits of larval fish in the Kuroshio and the adjacent waters,

southern Japan

S2-P9 Kiyotaka Hidaka

Dense occurrence of Fritillaria pellucida (Appendicularia: Fritillaridae) around the Kuroshio

S2-P10 Hiroshi Kuroda

Numerical experiments using a coupled physical–biochemical ocean model to study the

Kuroshio-induced nutrient supply on the shelf and slope region south of Japan: Case study of

Tosa Bay facing the Kuroshio

S2-P11 Joo Myun Park

Dietary patterns of walleye pollock, Gadus chalcogramma inhabiting the East/Japan Sea:

The influences of water depth, fish size and season

S2-P12 Xiaoke Hu

Distribution characteristics of primary feed in typical oceanic ranches and its response to the

environmental changes

S2-P13 Takafumi Hirata

Effects of photophysiology and chlorophyll a abundance on phytoplankton group-specific

primary production in Japanese waters using remote sensing

S2-P14 Chiyuki Sassa

Distribution, reproduction, and feeding of Symbolophorus californiensis (Teleostei:

Myctophidae) mature adults in the Kuroshio region during late winter: Evidence of a

southward spawning migration

S2-P15 Kentaro Note*

Relationship between abundance of young-of-the-year black sea bream Acanthopagrus

schlegelii and eelgrass bed Zostera marina vegetation in central Seto Inland Sea, Japan

S2-P16 Koji Suzuki

Spatial variations in community structure of haptophytes across the Kuroshio front in the

Tokara Strait

S4: Indicators for assessing and monitoring biodiversity of biogenic habitats

S4-P1 Seonock Woo

Transcriptome study of scleractinian coral Alveopora japonia

S4-P2 Fiona Davidson*

Predictive modeling methods for deep-sea sponges in the North Pacific Ocean

S4-P3 Kentaro Yoshikawa*

Changes in the fish community in seagrass bed on the Pacific coast of northeastern Japan before and after (2009-2017) the tsunami following the 2011 off the Pacific coast of Tohoku Fortheader

Earth quake

S5: Seasonal to interannual variations of meso-scale processes in the North Pacific

55. Scasona	to interantial variations of meso /submeso scale processes in the Portal Lacine
S5-P1	Naohiro Kosugi Characteristic of subsurface oxygen maximum in oligotrophic western North Pacific
S5-P2	Zhichun Zhang* Variability of the Pacific North Equatorial Current based on a 1/8° Pacific Model Simulation
S5-P3	Hideharu Sasaki Submesoscale dynamics in the Northeastern Subtropical Pacific Ocean
S5-P4	Yoshikazu Sasai Interannual variability of marine ecosystem in the Kuroshio Extension region
S5-P5 (cancelled)	Yisen Zhong* Instabilities of an anticyclonic eddy in its growing and decaying phase
S5-P6 (cancelled)	Elena Ustinova (for Eu. V. Samko) Two types of anticyclonic eddies eastward from Japan: An origin, characteristics, influence on fishery
S5-P7 (P->O)	Hiromichi Ueno (talk will be presented instead of a poster) Spatio-temporal variation of anticyclonic eddies in the western subarctic North Pacific
S7: Ecologic	al responses to variable climate changes and their applicability to ecosystem predictions
S7-P1	Gloria S. Duran*

S7-P1	Gloria S. Duran* Assessing the oceanographic variability impact in the western North Pacific on fishery resources in Japan using FORA-WNP30
S7-P2	Lu Guan* Characterizing time-series of bioacoustics, physical and biogeochemical properties in Saanich inlet (British Columbia, Canada): multi-scale temporal dynamics, causal relationships and forecasting
S7-P3	Hui Zhang
(cancelled)	Long term ichthyoplankton assemblage structure and its relationship between with environmental variation in the Yangtze Estuary
S7-P4	Hiroto Abe* Sediment-associated phytoplankton release from the seafloor in response to wind-induced

S7-P4	Hiroto Abe* Sediment-associated phytoplankton release from the seafloor in response to wind-induced currents in the Bering Strait
S7-P5 (cancelled)	Kirill Kivva* Geographic regions in the Bering Sea based on in situ oceanographic data

S7-P6	Minkyoung Bang*		

Responses of Japanese anchovy (Engraulis japonica) catch to environmental changes in the South Sea of Korea in recent decades: A generalized additive model approach

S7-P7 **Boris Espinasse***

Reconstructing foraging conditions experienced by salmon on the high seas

S7-P8 Jennifer Jackson Simple bio-optical proxies for phytoplankton abundance and compositions in complex coastal waters

S7-P9 Jennifer Jackson Dynamics governing upwelling and nutrient availability along the BC central coast (cancelled)

S8: Internal tides, nonlinear internal waves, and their impacts on biogeochemistry, climate and marine ecosystems via ocean turbulent mixing processes

S8-P1 Taiga Honma*

Response of plankton standing stocks and productivity to turbulent nitrate flux in the Kuroshio across the Tokara Strait

S8-P2 Naoki Yoshie

Effects of strong turbulent mixing on phytoplankton around the Tokara Strait

S8-P3

Characteristics of mode-1 and mode-2 nonlinear internal waves observed in the northern East China Sea

S8-P4 Konstantin Rogachev

> Amplified diurnal currents over the shallow banks and 18.6-year variability of salinity of the intermediate waters in the Western Subarctic Pacific

S8-P5 Marika Takeuchi*

Size distributions of marine aggregates in different aquatic systems

S8-P6 Takahiro Tanaka*

Elevated mixing in the Tsugaru Strait through internal hydraulic jump

S8-P7 Jianchao Li*

> The influence of Yellow Sea cold water mass on the early life history process of young Pacific cod (Gadus macrocephalus)

S9: Integration of science and policy for sustainable marine ecosystem services

S9-P1 Meng Su

Preliminary analysis of the Jimo coastal ecosystem with the Ecopath model

S9-P2 Artyom Y. Tadzhibaev*

The value of ecosystem services of the West Bering Sea

S10: Ocean acidification and deoxygenation and their impact on ocean ecosystems: Synthesis and next steps

S10-P1 Abigail McQuatters-Gollop and Jason Hall-Spencer

Communicating Ocean Acidification in East Asia: What are the key messages for policy makers and society?

S10-P2 Toshiya Nakano

Recent deoxygenation in the Japan Sea Proper Water in the northeastern Japan Basin

S10-P3

Temporal variation of the saturation state of carbonate in intermediate waters of western North Pacific

S10-P4 Miho Ishizu

> A marine carbon model coupled with an operational ocean model product for ocean acidification studies in the North Western Pacific

S10-P5 Mi-Ju Ye

(cancelled) Development and persistence of hypoxia and related environmental parameters at Jinhae Bay,

south coast of Korea in 2011-2015

S10-P6 Akio Ishida

Long-term Trends in surface ocean pCO₂ seasonality in the northwestern North Pacific

S11: Influence of climate and environmental variability on pelagic and forage species

S11-P1 Wentseng Lo

Spatiotemporal variations of chaetognaths associated with hydrographic features in the coastal waters off southwestern Taiwan

S11-P2 Mitsuhiro Ishino*

Why the body size of walleye pollock larvae in Funka Bay and the adjacent waters, Hokkaido was large in 2016?

S11-P3 Ching-Hsien Ho*

Changes in the fish species composition seasonality and in the coastal zones of the Tsushima warm current during periods of climate change: Observations from the set-net fishery of Chiba Prefecture in Japan

S11-P4 Chris Rooper

(cancelled) Linkages between pelagic temperature and zooplankton abundance, and growth and recruit-

ment of Pacific ocean perch in Alaska

S11-P5 Takeshi Okunishi

On the relationship between sea temperature and fishing ground formations of chub mackerel

in the region off Sanriku, northwestern Pacific

S11-P6 Yuji Terada*

Occurrence of Japanese whiting Sillago japonica in the shallow coastal waters of the central

Seto Inland Sea

S11-P7 Mei Sato*

Assessing the availability and accessibility of prey for the Southern Resident Killer Whales

S11-P8 Zhencheng Tao

Photobehaviors of the marine calanoid copepod Calanus sinicus under wavelength-specific

light

S11-P9 Suam Kim

Salmon and people in a changing world: Introducing the International Year of the Salmon

(IYS)

S11-P10 Ringo Nishio*

Distribution of demersal fishes in the southern Chukchi Sea and Northern Bering Sea after low

ice conditions

S11-P11 William J. Sydeman

Effects of climate variability on body condition of forage fish sampled by puffins in the Gulf

of Alaska

S12: Applying ecosystem considerations in science advice for managing highly migratory species

S12-P1 Kirill Kivva (for Alexei Orlov)

Changes in Pacific cod (*Gadus macrocephalus*) size distribution in the North Pacific Ocean over 6 millennia: Possible impacts of fishing pressure or environmental variability

S12-P2 Jia-Huei Lin*

Variation in the catch rate and distribution of swordtip squid (*Uroteuthis edulis*) associated with factors of the oceanic environment in the southern East China Sea

S12-P3 Momoko Ichinokawa

Review of stock status of Japanese domestic fisheries and new harvest control rule in Japanese domestic fisheries management

S12-P4 Tsutomu Tokeshi

Role of shallow channel to space -time variation of coastal fisheries resources -Relationship between coastal fisheries resources and oceanographic condition in Hyuga-Nada, Japan-

Biological Oceanography Committee Paper Session

BIO-P1 Emiko Takano

Biomass and community composition of microzooplankton with reference to their nutritional mode in the North Pacific Ocean

BIO-P2 Minju Kim*

Community structure of mesozooplankton during spring and summer in the Ulleung island,

Korea

BIO-P3 Ken-ichi Nakamura*

The role of ammonium excretion of small planktonic copepods in epipelagic nitrogen cycle in the subtropical North Pacific Ocean

BIO-P4 Seung Ho Baek

a ı

W1: Ecological roles of gelatinous zooplankton: Evaluation, integration and future prospects in a more gelatinous ocean	
W1-P1	Yusuke Kondo* Ecological impact of jellyfish fishery on symbionts of jellyfish in Thailand
W1-P2	Akane Iida* Morphological and molecular examination of <i>Aurelia</i> sp. in Orido Bay, Japan
W1-P3	Yumiko Obayashi Degradation of gelatinous zooplankton carcass by microbial community in seawater
W1-P4	Nan Wang* Carbon distribution strategy of <i>Aurelia coerulea</i> polyps in the strobilation process in relation to temperature and food supply
W1-P5	Hiroshi Miyake Jellyfish fauna changes before and after 2011 Tohoku earthquake and tsunami in southern part of Sanriku coast, Iwate, Japan

W4: Synthesizing projected climate change impacts in the North Pacific

W4-P1

Wonkeun Choi (talk cancelled, changed to a poster)
Projected changes in the sea surface wind in the east asian marginal seas from regional climate models

W6: Regional evaluation of secondary production observations and application of methodology in the North Pacific

W6-P1 Lian E. Kwong*

Zooplankton secondary production in high nutrient low chlorophyll (HNLC) and seasonally productive regions in the North Pacific

W6-P2 Takashi Fushima*

Estimation of egg production rate of Calanus sinicus from preserved samples

W6-P3 Yuji Yoshinaga*

Diel rhythm of egg spawning of the planktonic copepod Calanus sinicus in Sagami Bay, Japan

W6-P4 Julie Keister

Individual growth rate (IGR) measurements negatively correlate with aminoacyl-tRNA synthetases (AARS) activity in North Pacific krill, *Euphausia pacifica*

W8: Taking stock of marine ecosystem services in the North Pacific — Exploring examples and examining methods

W8-P1 Jie Chen*

(cancelled) An index to assess the health and benefits of the global ocean

W8-P2 Takaaki Mori

Economic value of ecosystem services and utility of coastal fisheries in Indramayu, Indonesia

General Poster Session

GP-P1 Soonmi Lee*

(cancelled) Temperature mediated effect on productivity-diversity relationship in marine pelagic

ecosystems: A modeling study

GP-P2 Minuk Lee

Age determination and growth estimation of the white-spotted conger eel, *Conger myriaster*

(Brevoort, 1856) in marine waters of South Korea

GP-P3 Akande S.O.*

(cancelled) Modelling environmental impacts and adaptation on sustainable climate and marine

ecosystems in the north-atlantic coast

GP-P4 Sangyeob Kim*

The environmental analysis for sustainable seaweed aquaculture management in Ariake Sea,

Japan

GP-P5 Xiuxia Mu*

(cancelled) Fishery biology of whitespotted conger Conger myriaster in the Yellow and East China Seas

GP-P6 Alexandra I. Chistyakova

Results of a longterm monitoring of the hatchery marked juvenile pacific salmon identification

during autumn migrations in the basin of the Sea of Okhotsk

GP-P7 **Josep V. Planas**

Assessment of reproductive development in female Pacific halibut (*Hippoglossus stenolepis*)

GP-P8 Josep V. Planas

Identification of molecular growth signatures in skeletal muscle of juvenile Pacific halibut (*Hippoglossus stenolepis*) for monitoring growth patterns in the Pacific halibut population

GP-P9 Josep V. Planas

Electronically monitoring release method as a proxy for Pacific halibut discard mortality rates in the directed Pacific halibut longline fishery

GP-P10 Jin-Young Seo

Effects of biocides of antifouling paints and by-products from vessels on embryos of a sea urchin, *Strongylocentrotus nudus*

GP-P11 Wishnu A. Swastiko*

The influence of moisture content on cloud growth when Tropical Cyclones occur in the maritime continent of Indonesia

GP-P12 Ma Zhiyuan

(cancelled) Integrated Assessment of Island Ecosystem in China

GP-P13 Yunlong Chen⁵

Assessing the vulnerability on fishes in the Yellow Sea and Bohai Sea

GP-P14 Jiazhen Sun

Ocean deoxygenation enhances the efficiency of CO₂ concentrating mechanisms in a diatom with stimulated photosynthetic performances

GP-P15 Roman Novikov

Coastal fishing of Pacific halibut (*Hippoglossus stenolepis*) and its prospects of development in the Asian part of the areal

GP-P16 Jeong Hyeon Kim*

Community organization of macrobenthic sessile organisms responding to the submerging time of artificial panels in the embayment of the East China Sea, South Korea

GP-P17 Masaki Kakita*

Behavior of microplastics in primary, secondary, tertiary, and sludge treatment processes in wastewater treatment plants in Japan

GP-P18 Garry Benico

Morphology and phylogeny of bloom-forming *Takayama* sp. associated with the recent fish kill events in the Philippines

GP-P19 Lisha Guan*

Statistical modeling for exploring diel vertical distribution and spatial correlations of marine fish species — A new perspective to look at species interactions

GP-P20 Kazuya Takahashi

Unarmored dinoflagellate *Kapelodinium* sp. with chloroplast derived from haptophyte *Chrysochromulina* sp.

GP-P21 Qiufen Li

Temporal and spatial characteristics of bacterial diversity in the environments of cage and kelp cultural area in Xiangshan Bay, China

GP-P22 Li-Xiang Li

Assessing the outcomes of stocking hatchery-reared juveniles of *Girella punctate* in the northeastern coast of Taiwan

GP-P23 (cancelled)	Chunjiang Guan The state of red tide of China in 2017
GP-P24	Atsuko Yamaguchi Age and growth of the herbivorous fish, <i>Kyphosus bigibbus</i> , determined by accurate age determination techniques, for elucidating the effects on algal ecosystems in the Northwest coast of Kyushu, Japan
GP-P25	Georgiy S. Moiseenko Use of empirical orthogonal functions for monitoring coccolithophores in the upper layer of sea water
GP-P26	Wai Mun Lum* Ultrastructure and phylogeny of <i>Chattonella subsalsa</i> and <i>C. marina/ovata/antiqua</i> collected from various countries
GP-P27	Misako Matsuba Accumulation of tsunami debris on the seafloor depends on tsunami impact, bathymetry and ocean velocity
GP-P28 (cancelled)	Nadezhda Aseeva The Okhotsk Sea de-oxygenizing influence on deep-water fishes
GP-P29	Hirano Katsushi* Can a deep-sea copepod trophically utilize bacterial bioluminescence and chitinolysis?
GP-P30	Jin-Wook Song* Characteristics of dissolved organic matter in Submarine Groundwater Discharge (SGD) in Jeju Island
GP-P31	Min-young Lee Monthly distribution of organic matter in precipitation of Jeju Island
GP-P32	Yoichi Era Microplastic pollution in freshwater ecosystem – A case study of inland lakes in Japan
GP-P33	Ken-ichi Kitahara Identification of terrestrial sources of microplastics into the aquatic environment
GP-P34 (cancelled)	Jie Chen Using blue carbon in climate regulation
GP-P35 (cancelled)	Tatiana Orlova The toxic dinoflagellate <i>Prorocentrum foraminosum</i> and its associated bacteria from the culture collection "Marine Biobank" NSCMB FEB RAS
GP-P36	Jinik Hwang Taxonomic profiles in metagenomic analyses of marine dinoflagellate communities in Jinhae Bay, Korea
GP-P37	Jun-Ho Hyung Absolute quantification of <i>Oxyrrhis marina</i> and <i>Oxyrrhis maritima</i> in Korean waters using chip-based digital PCR (dPCR) as a novel detection method
GP-P38	Koji Fujita* Influence of submarine groundwater discharge on feeding and growth of fish

GP-P39	Shohei Takemoto Influence of ammonium derived from hot spring drainage on downriver and estuarine ecosystems
GP-P40 (cancelled)	Taehee Lee Changes of nitrogen and carbon budget by effluent of land-based aquaculture farm in the coastal area of Jeju, Korea
GP-P41	Bo ram Lee Distribution and population structure of <i>Euphausia pacifica</i> in Korean waters
GP-P42	Jorge García Molinos VoCC: A new R package for calculating the velocity of climate change and related landscape climatic metrics
GP-P43 (cancelled)	GwangSeob Park* The study of change of marine environment around Ieodo Ocean Reasearch Station using wave glider
GP-P44	Masakazu Higaki NEAR-GOOS: Developing sustained ocean observations for enhanced services in the north- eastern Asian marginal seas
GP-P45	Larissa Gayko Influence of variability of thermal conditions on the development of shellfish on marine farms (North-Western part of the Sea of Japan)

Upcoming Event

PICES-2019, October 16–27
Connecting Science and Communities in a Changing North Pacific Victoria, BC, Canada www.pices.int/PICES-2019

Prepared by PICES Secretariat www.pices.int
