- 6. Conclusions**

# Needs of Adaptation & Mitigation in Coastal Environment

Adaptation: Adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities (IPCC, 2007)

## ➤ Over 20% of Fisheries Grounds in East Coast of Korea Affected by Whitening Phenomena

- **Rise of sea surface temp. (SST)**
- Bloom of coralline algae
- Over-propagation of sea urchin
- Poor nutrients in seawater

### ※ Examples of Whitening Phenomena in Korea ('04)

| Coastal Province | Fisheries Ground (ha) | Whitening Area (ha) | Share (%) |
|------------------|-----------------------|---------------------|-----------|
| Gangwon          | 11,216                | 776                 | 7         |
| Gyeongbuk        | 6,663                 | 2,110               | 32        |
| Jeju             | 14,451                | 4,541               | 31        |
| <b>Total</b>     | <b>32,330</b>         | <b>7,427</b>        | <b>23</b> |

### \* Whitening Area in Jeju Island

(Red line: '98, Blue line: '04)

✓ Climate change → SST Rise → Coralline algae bloom → “Whitening” spreading  
 ➔ Coastal desertification

## ➤ “Greenhouse Gas Removal by Seaweed” Program in Korea (2006~2012)

### Coastal CO<sub>2</sub> Removal Belt

### CO<sub>2</sub> uptake rate of seaweed

- PI: Prof. Ik Kyo Chung, Pusan Nat'l Univ.
- Funded by MLTM (Ministry of Land, Transport and Maritime Affairs)

## Nat'l Roadmap for Climate Change Adaptation and Mitigation (MLTM, '08.2)

Protection of people's livelihoods & property  
Contribution to the retardation of global warming  
in maritime and fisheries sector of Korea

- Supervised by RIST
- MLTM; Ministry of Land, Transport and Maritime

### 5 Key Strategies

#### Adaptation in Coastal Env.

*Territorial security*

- ✓ Assessment of Risk & Vulnerability
- ✓ Prediction & Retardation of Coastal Change due to CC
- ✓ Management of Coastal Env. & Eco-system

#### Adaptation in Fishery Resources

*Food control*

- ✓ Monitor. & Predict. Fishery Resources' Variation
- ✓ Manage. & Protect. Fishery Resources
- ✓ Development of New Culture & Catch

#### Mitigation of GHG in Mar. Env.

*GHG reduction*

- ✓ Renewable Marine Energy Development
- ✓ Mar. Sink & Storage Tech. Development
- ✓ Management of Discharge Inventory & Energy Efficiency

#### Building-up Marine Science & Monitoring

*CC Research*

- ✓ Nat'l Std. Predictive Model for Mar. CC
- ✓ Science of Currents & Sea-level Change
- ✓ Monitoring & Prediction of Eco-system Impacts

#### Strengthening Policy Making

*Policy decision*

- ✓ Preparation of 2012 YEOSU EXPO
- ✓ Education & Train Marine CC Expert
- ✓ Int'l Cooperative Network for CC

# Outline of Our Approach; Adaptation & Mitigation

## ➤ Restoration of Seaweed Beds using BioSlag in Vulnerable Coastal Area

(Adaptation)

- Material stabilized by cooling after melting it over 1,500°C during steelmaking process
- Higher contents of Fe, Ca

## ➤ CO<sub>2</sub> Mitigation by Slag Carbonation & Seaweed Photosynthesis

(Mitigation)

# Theoretical Backgrounds

## Carbon Capture & Storage (IPCC Technical Summary, 2005)

### Mineral Carbonation Method

**Slag Carbonation**

### Ocean Storage Method

**Installation of Slag Seaweed Reef**

In-house CO<sub>2</sub> Sequestration

Natural CO<sub>2</sub> Storage by Seaweeds

**CO<sub>2</sub> Mitigation & Adaptation to Coastal Climate Change**

## Carbonation Mechanism

### Schematic of carbonation process

### Aqueous carbonation of calcium oxide

(Environ. Sci. Technol. 2005)

### Mechanism for accelerated carbonation

1. Diffusion of  $\text{CO}_2$  in air
2. Permeation of  $\text{CO}_2$  through the solid
3. Solvation of  $\text{CO}_{2(\text{g})}$  to  $\text{CO}_{2(\text{aq})}$
4. Hydration of  $\text{CO}_{2(\text{aq})}$  to  $\text{H}_2\text{CO}_3$
5. Ionization of  $\text{H}_2\text{CO}_3$  to  $\text{H}^+$ ,  $\text{HCO}_3^-$ ,  $\text{CO}_3^{2-}$  (pH fall from 11 to 8)
6. Dissolution of cementitious phases  $\text{C}_3\text{S}$  and  $\text{C}_2\text{S}$  (cyclic and generating a considerable exotherm)
7. Nucleation of  $\text{CaCO}_3$ ,  $\text{C-S-H}$
8. Precipitation of solid phases
9. Secondary carbonation

(J. Hazardous Materials, 2004)

## Seaweed Beds Restoration Model

# Results of BioSlag Application Study

## Adaptation: Restoration of Seaweed Beds

Geomundo (Nov. 2000)  
179 EA, Fish Reef

Seogwipo (Feb. 2001)  
5 tons, BioSlag Stone

Namae, Yangyang (Jun. 2005)  
3,000 tons, Seaweed Forests

Jeongdongjin, Gangneung (Oct. 2004)  
450 tons, BioSlag Stone  
(Dec. 2005)  
450 EA, Seaweed Reef

Hosan, Samcheok (Dec. 2006)  
450 EA, Seaweed Reef

Cheongjin, Pohang (Feb. 2008)  
25,000 tons, Seaweed Forests

Pyeongsan, Namhae (Nov. 2007)  
16,000 tons, Seaweed Forests

✓ More effective attachment and growth of seaweed on BioSlag product than on other materials

## Case study in Namhae Island, South Coast of Korea

**Underwater  
photo**

※ Comparison of seaweed weight on each bed

## ※ Distribution of seaweed species

✓ Most dominant species on the slag bed is *Ecklonia cava*

## Mitigation: CO<sub>2</sub> Fixation by Seaweeds

### Wet weight and CO<sub>2</sub> uptake rate on various seaweed beds in Korea

|                                       | Wet weight (g/m <sup>2</sup> ) | CO <sub>2</sub> uptake (g/m <sup>2</sup> /yr) |
|---------------------------------------|--------------------------------|-----------------------------------------------|
| Slag bed (East Coast, 3yrs)           | 3,720                          | 7,820                                         |
| Slag bed (Geomun Island, 7yrs)        | 4,330                          | 11,490                                        |
| Artificial reef (East Coast)          | 660                            | -                                             |
| Artificial reef (South Coast)         | 580                            | -                                             |
| Artificial reef (Jeju Island)         | 640                            | -                                             |
| Artificial reef (standard)            | 1,900                          | -                                             |
| <i>Ecklonia cava</i> (Jeju Island, A) | 2,080                          | 5,520                                         |
| <i>Ecklonia cava</i> (Jeju Island, B) | 1,770                          | 4,700                                         |
| <i>Ecklonia cava</i> (Jeju Island, C) | 1,630                          | 4,320                                         |
| <i>Ecklonia cava</i> (Jeju Island, D) | 1,550                          | 4,120                                         |
| <i>Ecklonia cava</i> (Jeju Island, E) | 1,320                          | 3,500                                         |
| <i>Ecklonia cava</i> (Jeju Island, F) | 1,220                          | 3,220                                         |

78 t-CO<sub>2</sub>/ha/yr  
115 t-CO<sub>2</sub>/ha/yr

Calculation from  
CO<sub>2</sub> reduction rate  
of each species FW

## Chemical analysis of CO<sub>2</sub> uptake amounts by seaweeds on slag bed

Measurement of 2 parameters (TCO<sub>2</sub>, TA)

Using Thermodynamic Model

$$TA = [HCO_3^-] + 2[CO_3^{2-}] + [H_2BO_3^-] - [H^+]$$

$$TCO_2 = [HCO_3^-] + [CO_3^{2-}] + [CO_2(g)]$$

$$pH = -\log[H^+]$$

→ pCO<sub>2</sub> calculation

$$\delta CO_2 = pCO_{2 \text{ control}} - pCO_{2 \text{ in bed}}$$

(+; sink, -; source)

$$= +9.8 \mu \text{ atm}$$

$$\delta TIC = TIC_{\text{control}} - TIC_{\text{in bed}}$$

$$= 64.7 \mu \text{ mol/kg}$$

$$\rightarrow 3.9 \text{ gCm}^{-2}\text{d}^{-1} \approx 5,200 \text{ gCO}_2\text{m}^{-2}\text{yr}^{-1}$$

## Mitigation: Carbonation of Steelmaking Slag

Formation of  $\text{CaCO}_3$  layer on the surface of slag

## Lab. & Pilot Test (limestone calcination plant in Pohang Steel Works)

✓ Sequestered amount of CO<sub>2</sub> : ~0.3 t-CO<sub>2</sub>/ton-slag

- Slag size 20~40 mm
- Moisture content 4.5%
- CO<sub>2</sub> ~25% v/v

# Ongoing Activities with Korean Gov.

☐ **Subject : Memorandum of Understanding Between the MLTM (former MOMAF) and POSCO for Mutual Cooperation with Marine Climate Change (Nov. 19, 2007)**

☐ **Major Collaboration Projects**

**1) Adaptation to marine climate change**

- Biological impact assessment research of slag for marine utilization
- **Restoration of coastal ecosystems using steelmaking slag**
- **CO<sub>2</sub> fixation and bio-energy development using coastal seaweed belt**

**2) Preparation of policy & system for marine climate change**

**3) CO<sub>2</sub> capture and storage (CCS) R&D**

**4) International cooperation regarding marine climate change**

# Conclusions

- ❑ Marine utilization of BioSlag would be a helpful measure for adaptation to coastal climate change and also for mitigation of CO<sub>2</sub>.
- ❑ RIST & POSCO will continue collaborative work with Korean Government in response to coastal climate change through promotion of seaweed belt and CO<sub>2</sub> mitigation using BioSlag beds.

An underwater photograph showing a dense field of green seaweed and coral on the ocean floor. The water is a clear, vibrant blue, and the scene is brightly lit, creating a serene and natural environment. The text is centered over the upper half of the image.

**THANK YOU  
FOR YOUR KIND ATTENTION !**
