

# Environmental Indicators and Pacific Salmon Conservation

*Thomas C. Wainwright, William T.  
Peterson,  
Peter W. Lawson, and Edmundo Casillas*

*NOAA National Marine Fisheries Service  
Northwest Fisheries Science Center  
Newport, Oregon*

# Acknowledgements

- All those who collected the data
- Dan Goodman and Jim Overland provided analytic suggestions
- Funding was provided in part by:
  - ▶ NOAA Fisheries and the Environment (FATE)
  - ▶ U.S. GLOBEC program through the NOAA Coastal Ocean Program
  - ▶ Bonneville Power Administration

# Outline

- Conservation of Pacific Salmon
  - ▶ Traditional Harvest Management (HM)
  - ▶ Conservation Biology (CB) [NOT TODAY!]
- Use of Environmental Indicators
  - ▶ Quantitative Forecasts
  - ▶ Qualitative “Warnings”
- Are Indicators Useful in Harvest Management?
- Concluding Advice

# Salmon Harvest Management

- U.S. West Coast Perspective
- Three Steps
  - ▶ Assessment of Stock History
    - Spawner Abundance
      - Based on various kinds of surveys
    - Harvest Rates
      - Based on catch reporting, tag returns, models
  - ▶ Forecasts of Stock Abundance
    - Techniques vary by stock and agency
      - Stock-Recruit Models, Sibling Regressions, Environmental Regressions (one case)
  - ▶ Management Decisions
    - Stock-specific escapement goals
    - Allocation: time/area/species openings
      - “weak stock” management

# How Can Indicators Be Used in HM?

- Quantitative Advice: Forecasts
  - ▶ Stock forecast regression models
    - Loggerwell et al., Scheurrell et al., etc.
  - ▶ Multi-Indicator Statistical Approaches
- Qualitative Advice: Warnings
  - ▶ Qualitative assessment of state of the environment
    - Example: El Niño
      - "An ENSO event is starting, returns will probably be low, we advise caution"
    - Example: Qualitative multi-indicator summaries
      - Peterson et al. approach

	Juvenile migration year				Forecast of adult returns	
	2000	2004	2005	2006	Coho 2006	Chinook 2007
<b>Large-scale ocean and atmospheric indicators</b>						
PDO	■	■	■	■	●	●
MEI	■	■	■	■	●	●
<b>Local and regional physical indicators</b>						
Sea surface temperature	■	■	■	■	●	●
Coastal upwelling	■	■	■	■	●	●
Physical spring transition	■	■	■	■	●	●
Deep water temp. & salinity	■	■	■	■		
<b>Local biological indicators</b>						
Copepod biodiversity	■	■	■	■	●	●
Northern copepod anomalies	■	■	■	■	●	●
Biological spring transition	■	■	■	■	●	●
Spring Chinook--June	■	■	■	■	●	●
Coho--September	■	■	■	■	●	●

*Key*

■	good conditions for salmon marine survival	●	good returns expected
■	intermediate conditions for salmon marine survival	●	poor returns expected
■	poor conditions for salmon marine survival		

# Using Indicators to Improve Forecasts

- Rationale
  - ▶ Salmon marine survival is the main determinant of returns
  - ▶ Marine survival depends on the state of the ocean
  - ▶ Indicators of ocean state (physics and ecology) correlate with recent trends in marine survival
  - ▶ Therefore, using indicators should improve forecasts and management
- This is intuitively obvious!
- But, does it work in practice?

# What Requirements Must Be Met?

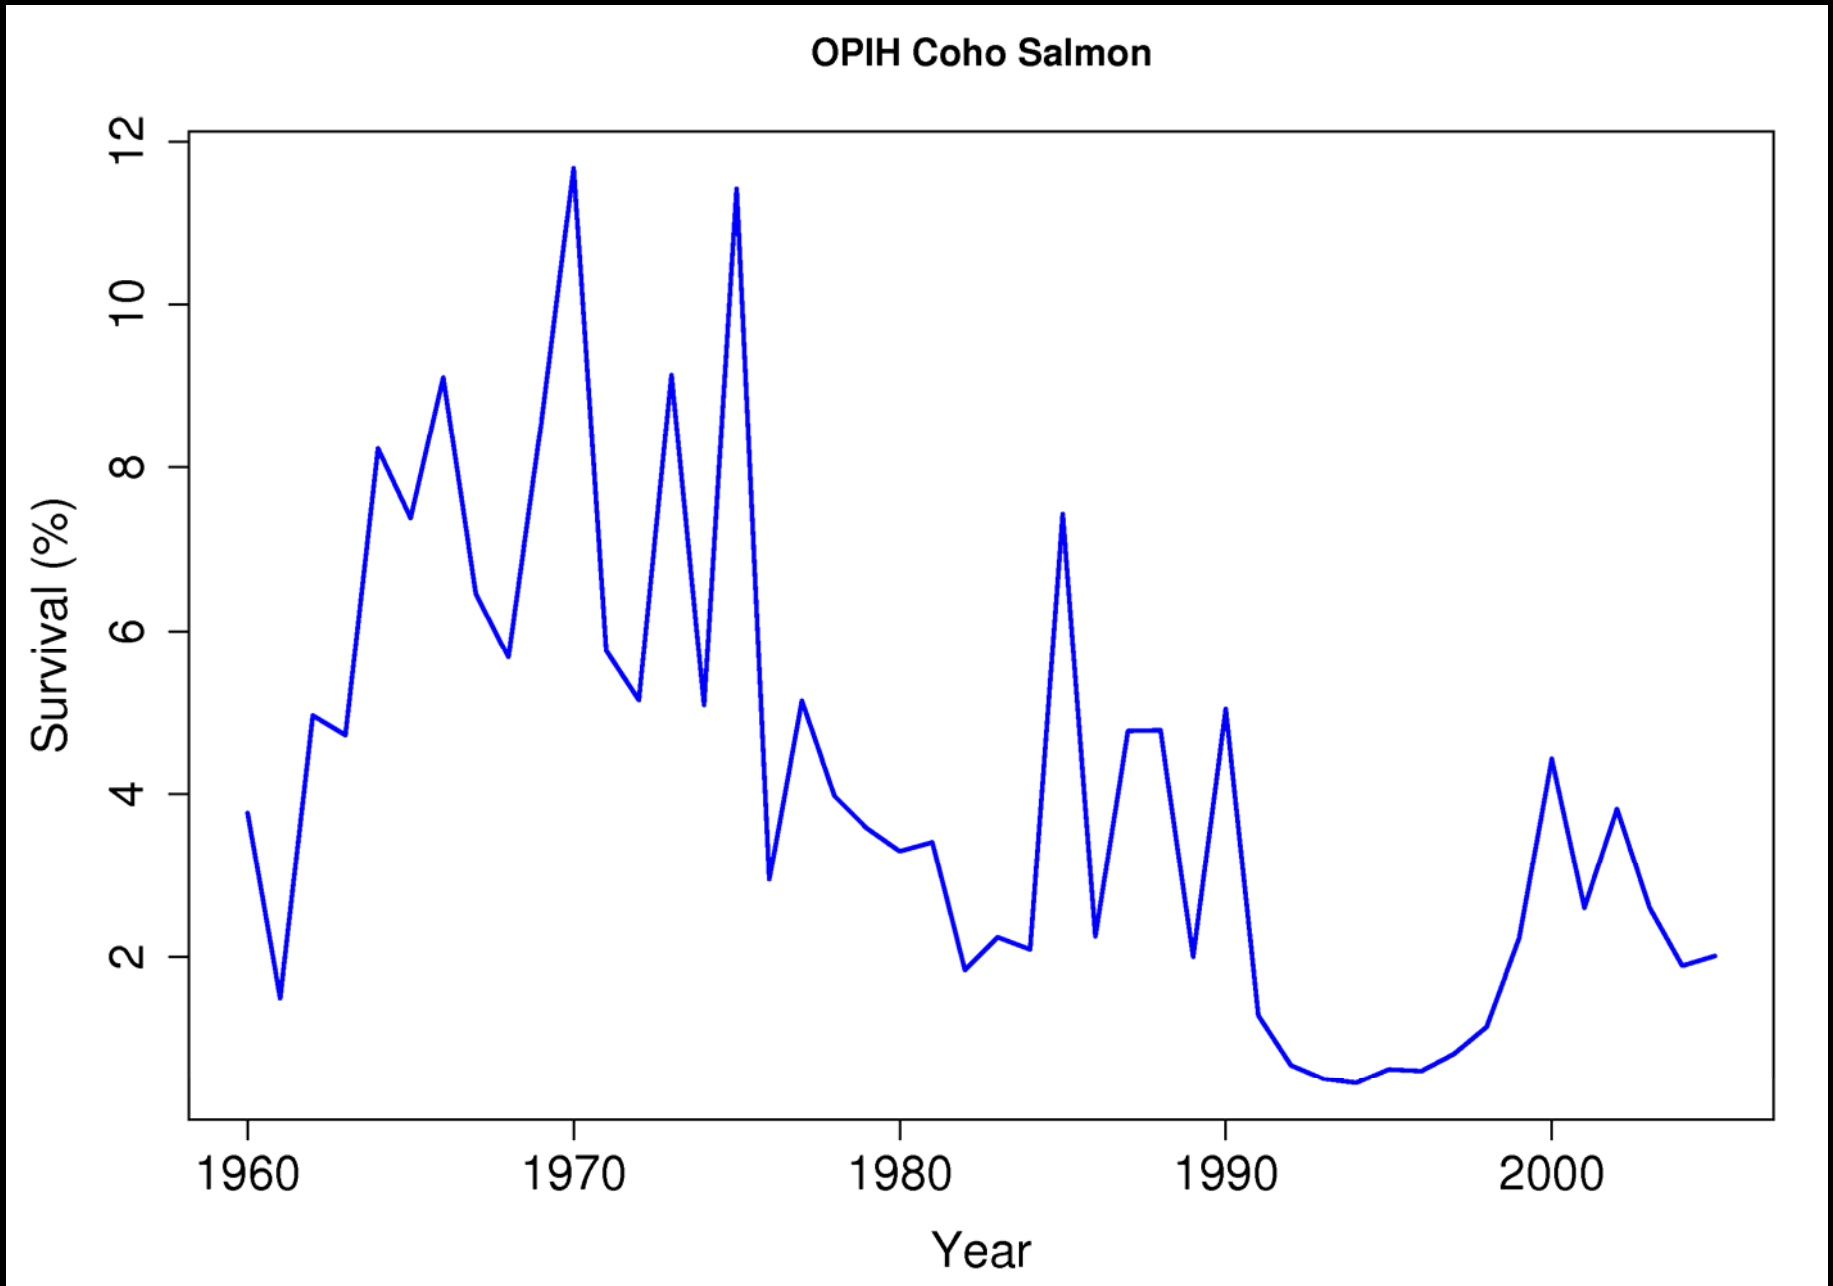

- Advice from Kaje & Huppert (2007, Nat. Res. Model.)
  1. Forecasts must match the management system
    - in time and space
    - direct linkages of indicators to stock response
  2. Forecasts must have sufficient skill
  3. Forecasts must lead to a clear management response
  4. Forecasts must be valuable
    - must increase economic value or improve meeting conservation goals
    - must be better than the existing management method

# Case Study: OPIH coho salmon

- Attempt to quantify predictive relationships
- 3-step process:
  - ▶ Compute regressions of fish stock on individual indicators
  - ▶ Use regressions to forecast recruits 1-year ahead
  - ▶ Evaluate forecast skill
- Problems
  - ▶ Indicator time series lengths vary, many recently developed indicators have very short (< 10 years) series
  - ▶ Relationships vary over time

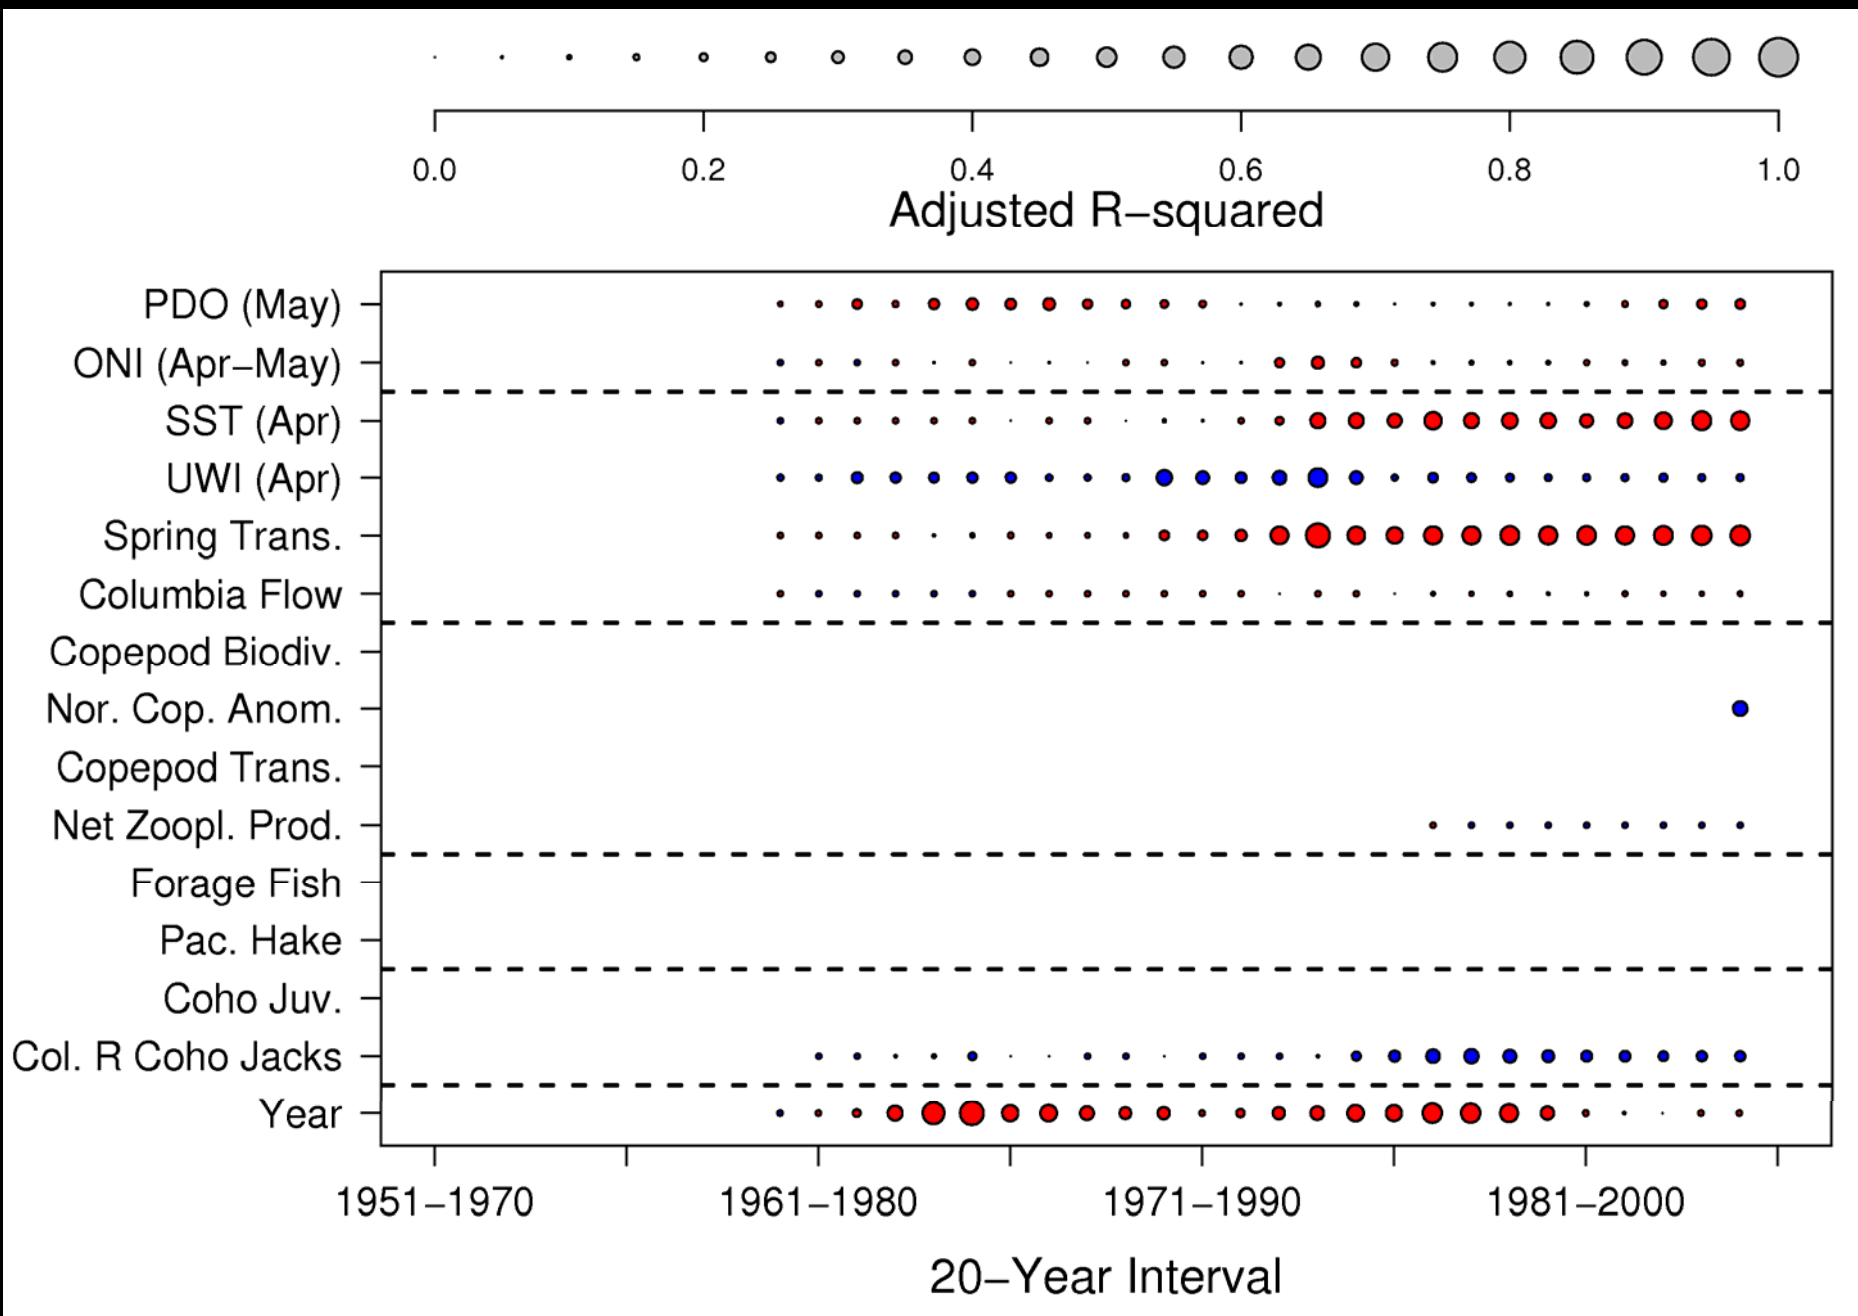

# An Example: OPI Hatchery Coho

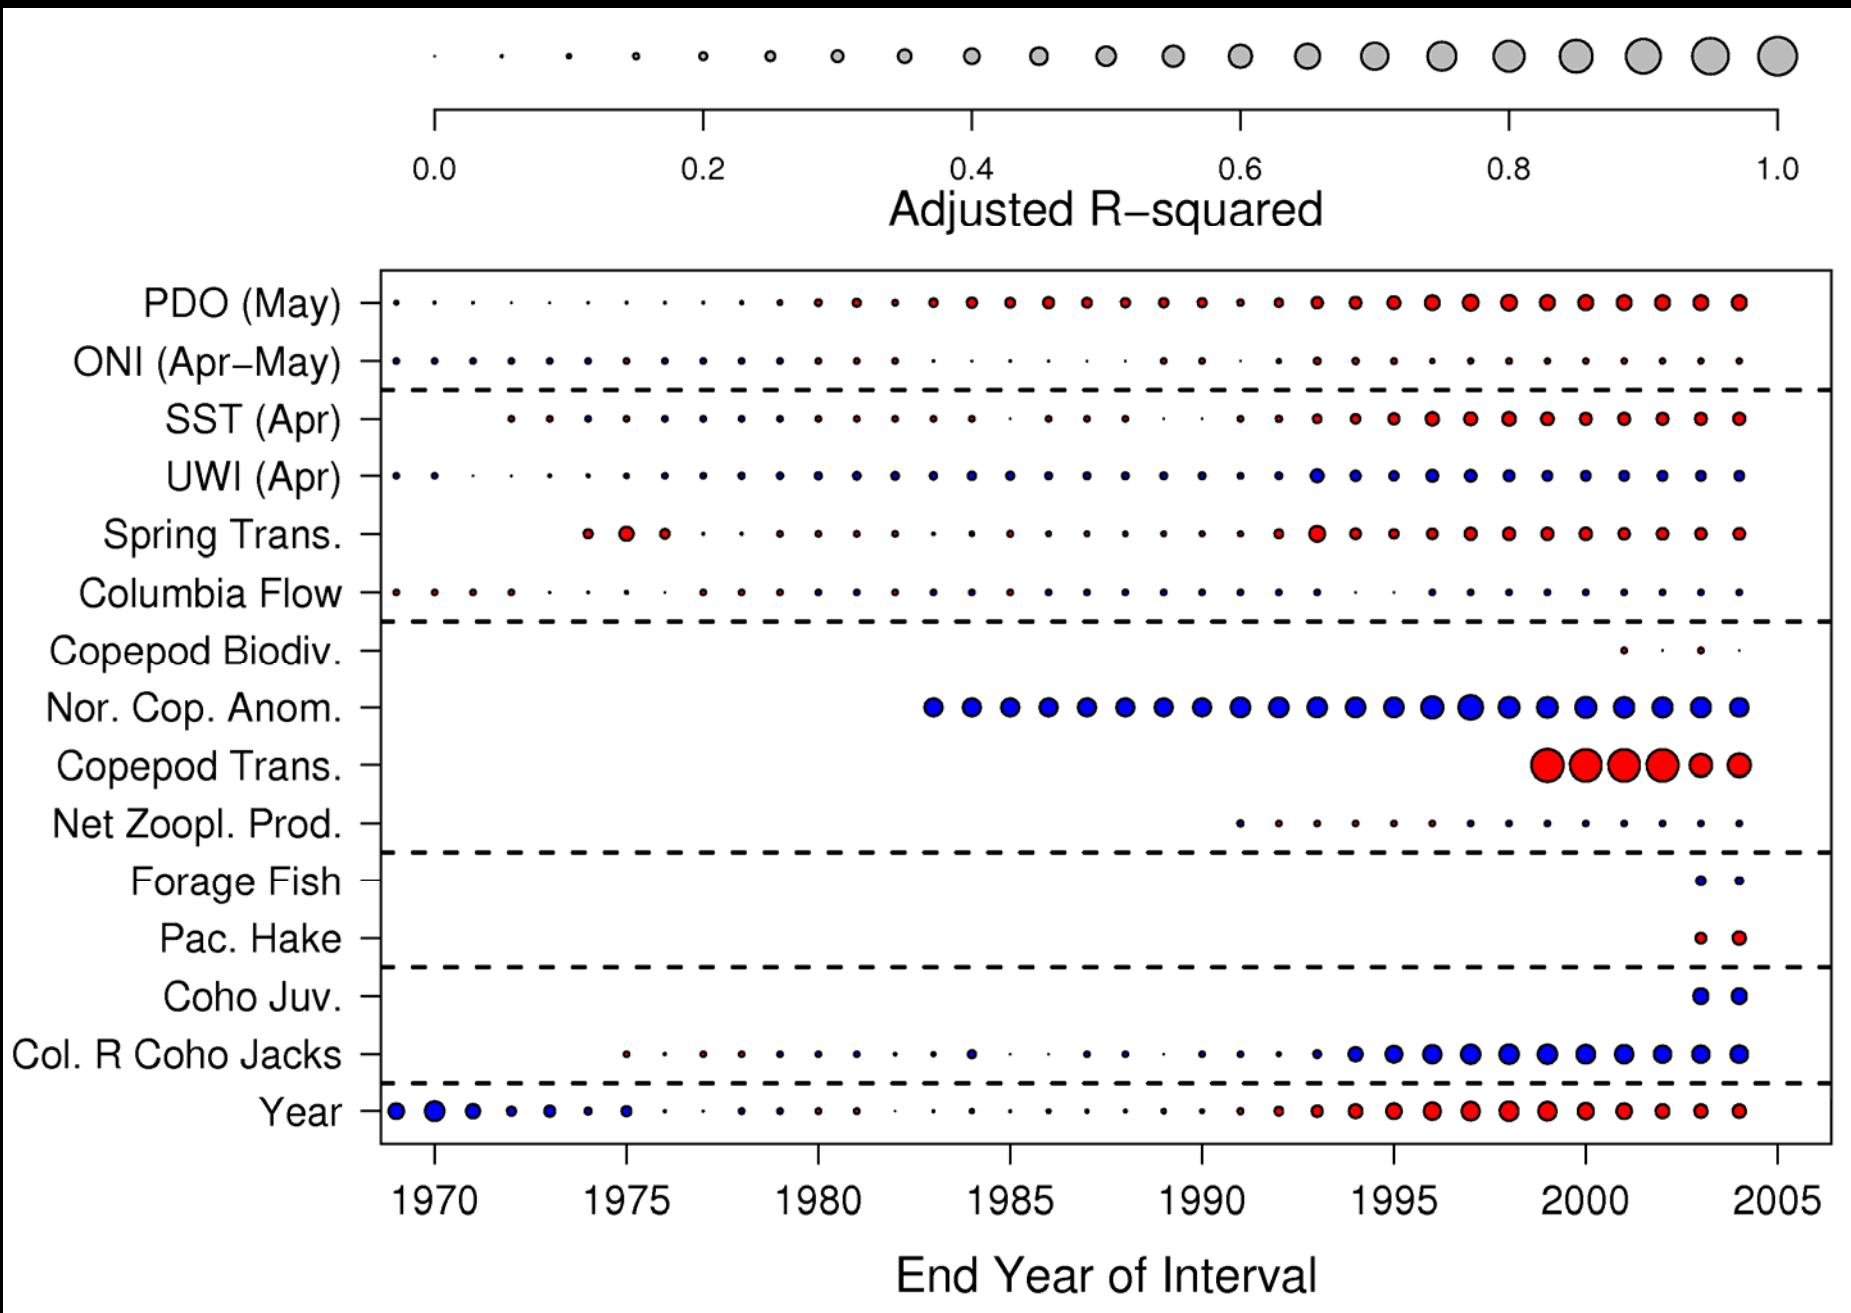

# Correlations, 5-year Intervals

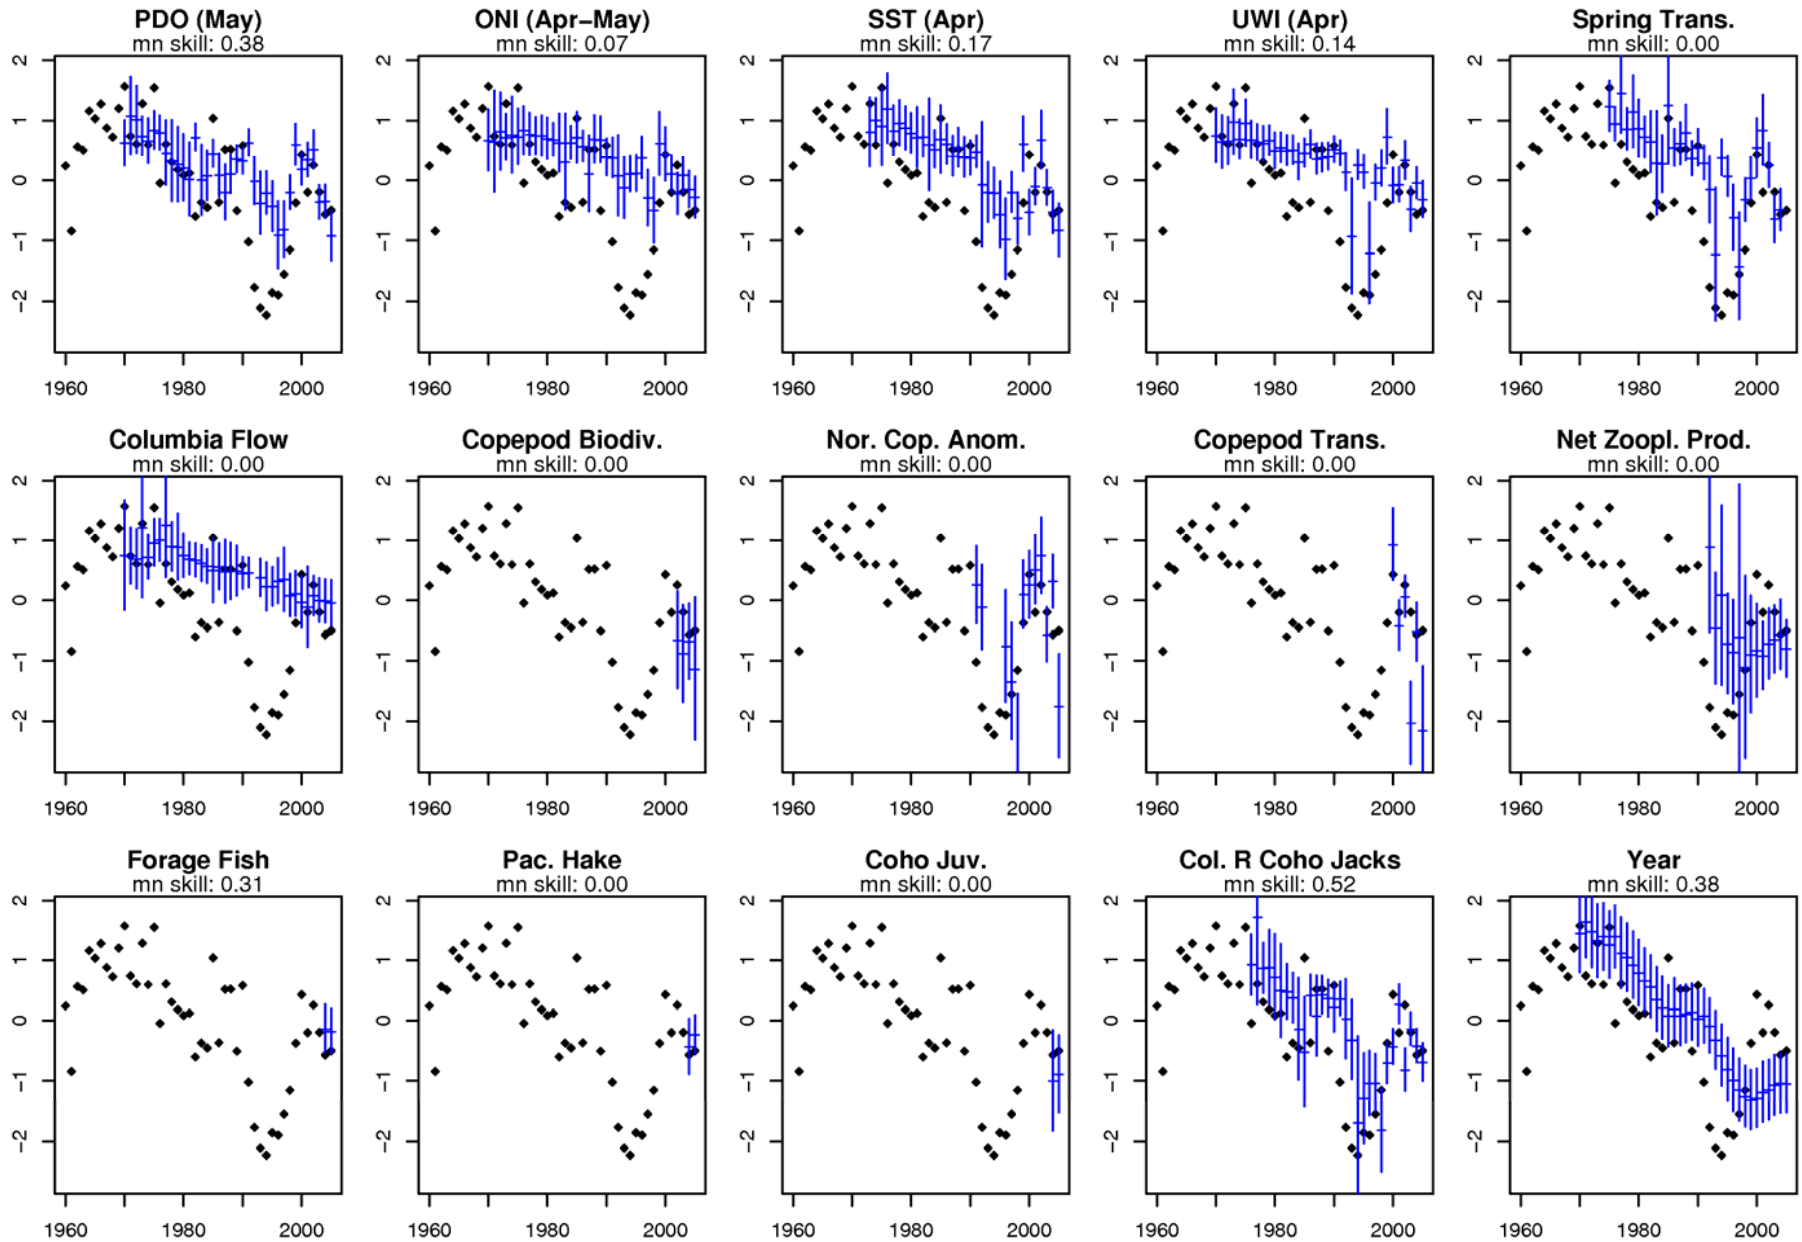

# Correlations, 20-year Intervals

# Correlations, Long-term Data

# 1-Step Ahead Forecasts

# Conclusions

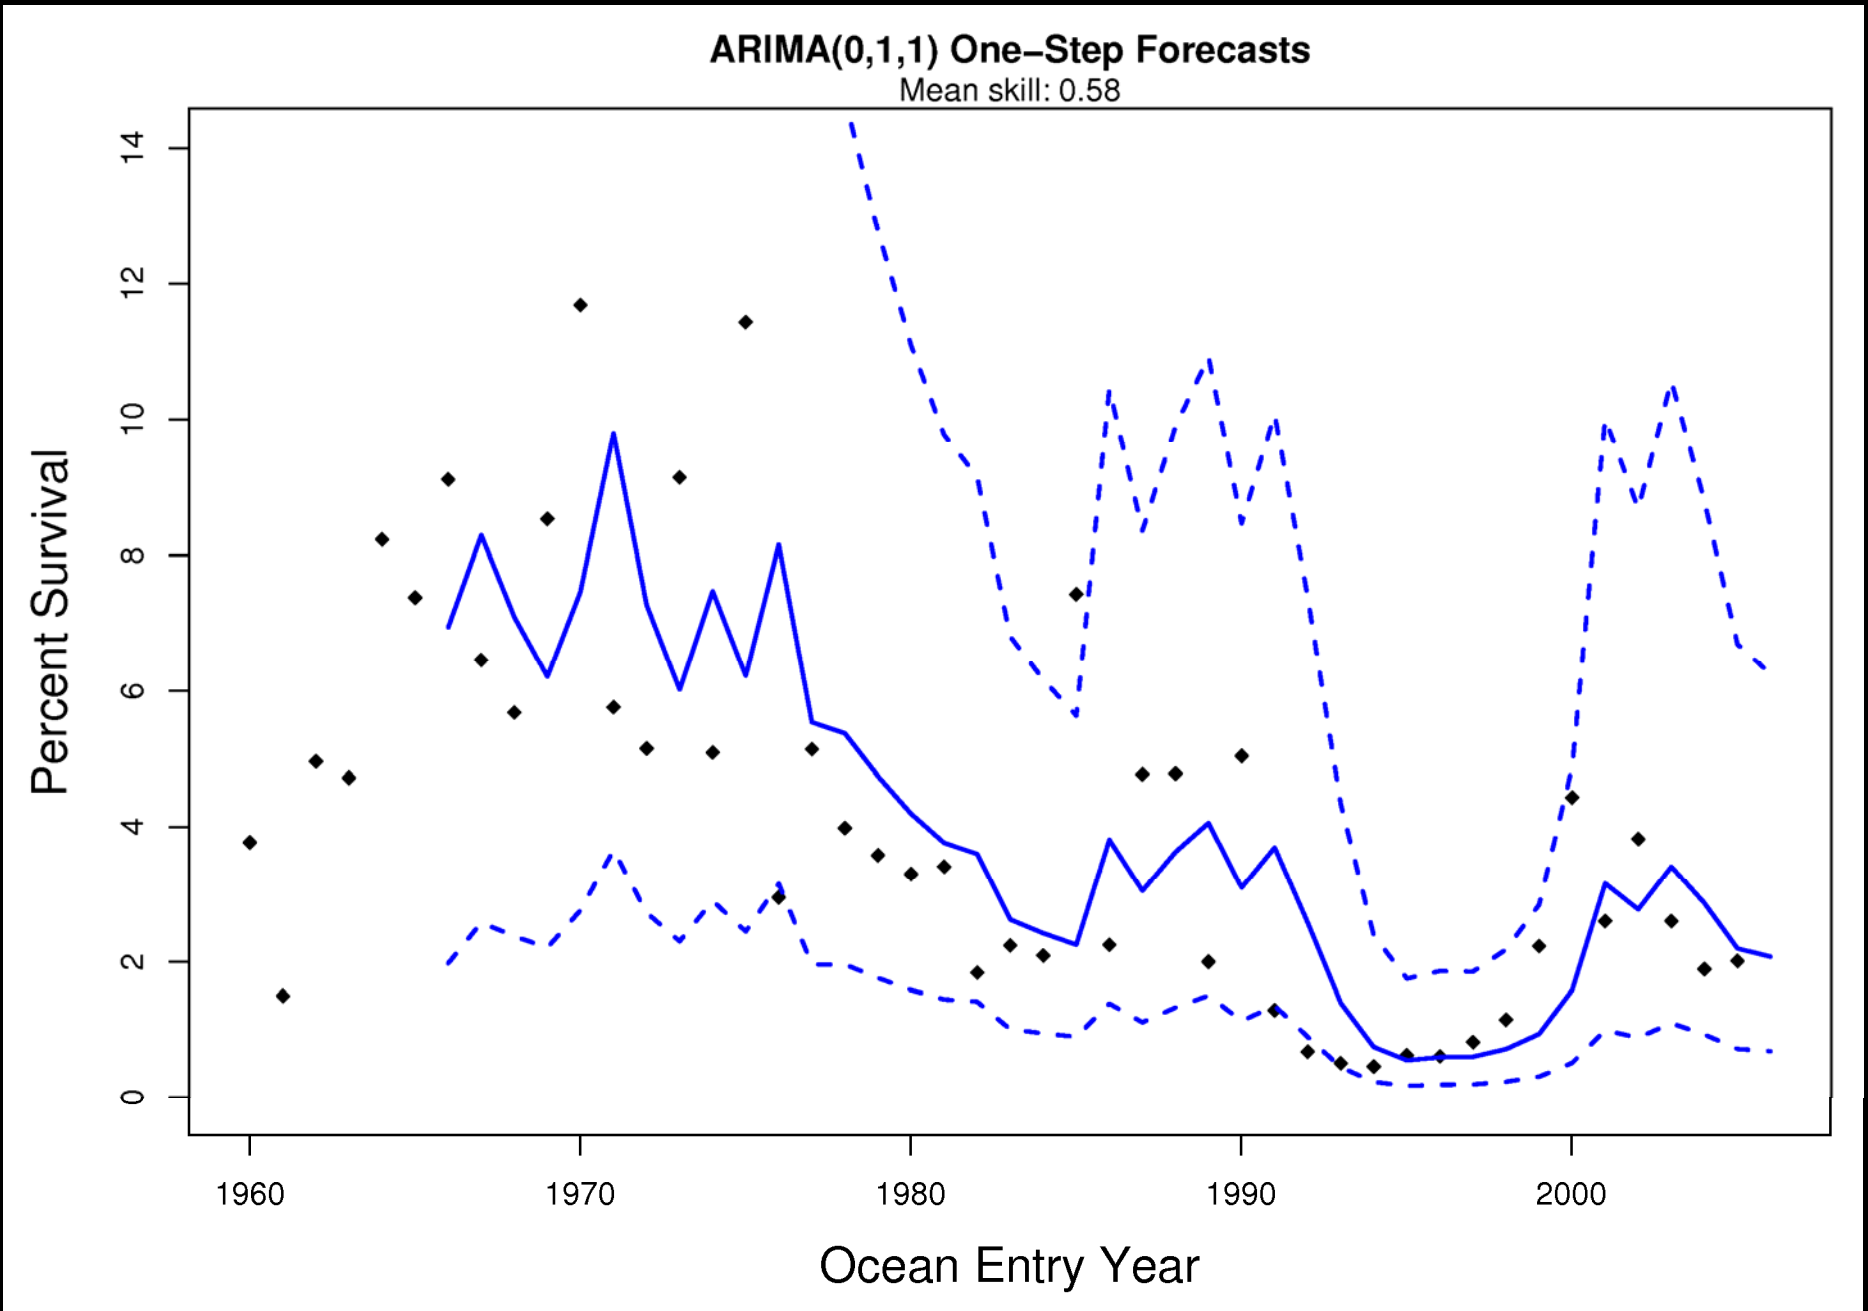

- Strong Short-term Correlations  
<DO NOT EQUAL>  
Long-term Relationships
- High "Hindcast"  $R^2$   
<DOES NOT EQUAL>  
Forecast Skill
- More Direct Linkages  
<DOES EQUAL>  
Better Skill

# Are These Indicators Useful?

- Revisiting Kaje & Huppert requirements
  1. Forecasts must match the management system
    - in time and space -- **YES, for regional indicators**
    - direct linkages of indicators to stock response -- **YES**
  2. Forecasts must have sufficient skill -- **Marginal**
  3. Forecasts must lead to a clear management response -- **YES**
  4. Forecasts must be valuable -- **Not Evaluated**
    - must increase economic value or improve meeting conservation goals
    - must be better than the existing management method

# Simple Time-Series Forecast

# Concluding Advice

- Nature is variable
  - ▶ climate regime changes and ecosystem phase shifts influence indicator relationships
- $R^2$  doesn't equal prediction
  - ▶ Little relationship with forecast skill, especially for short time series
- To provide management-relevant forecasts, we need to look at utility, not just explanatory power
  - ▶ At a minimum, evaluate forecast skill, not just hindcast goodness-of-fit
  - ▶ Best to evaluate predictors in a Management Strategy Evaluation (MSE) framework
- While Ecosystem Indicators may not be useful in tactical (short-term) harvest management, they are important in strategic planning
