

# Zooplankton community structure in the ports of Mumbai, India: An account since 1940's.

*Chetan A. Gaonkar, Venkat Krishnamurthy  
& Arga Chandrashekar Anil*

# Mumbai

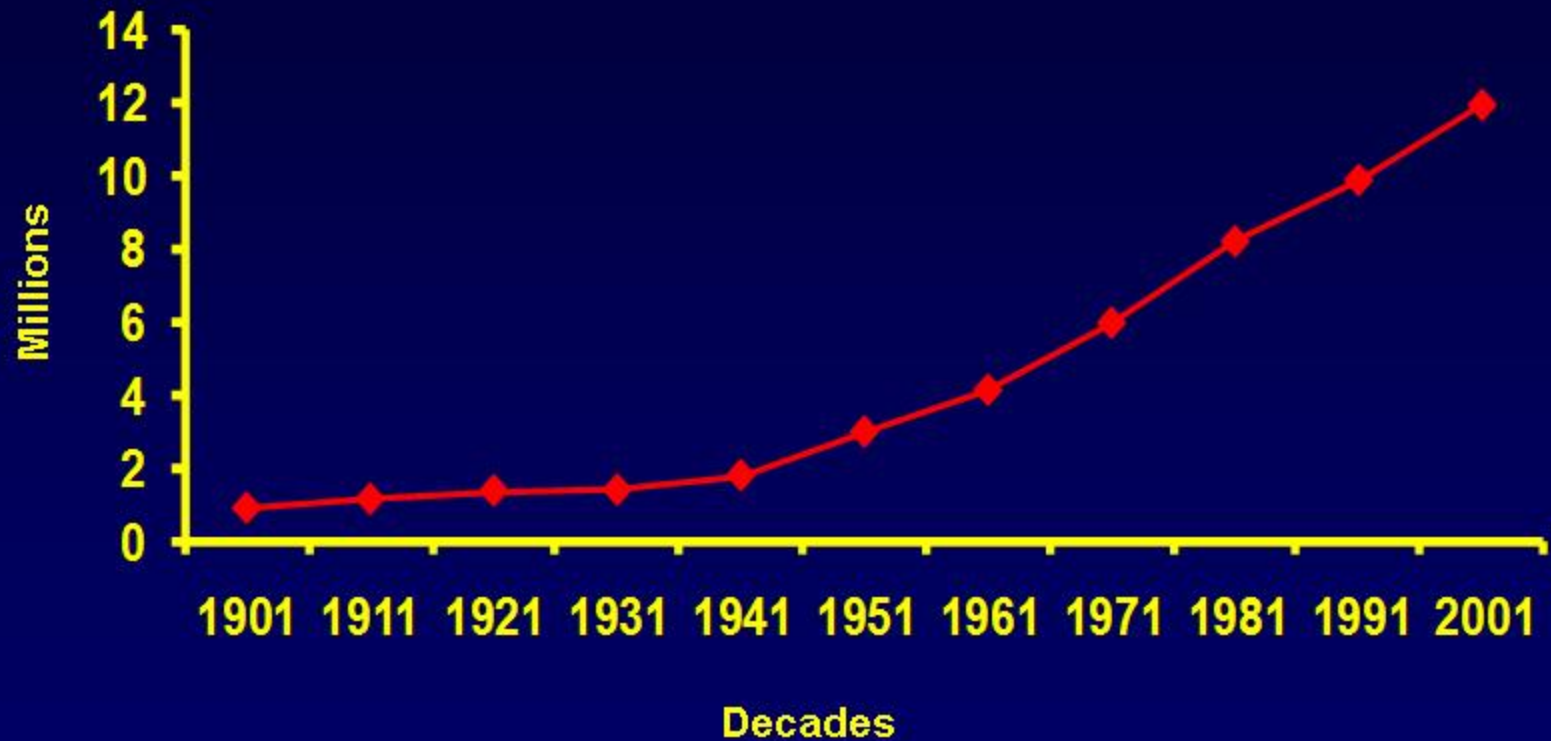

The second largest coastal city in the world

India's  
premier port

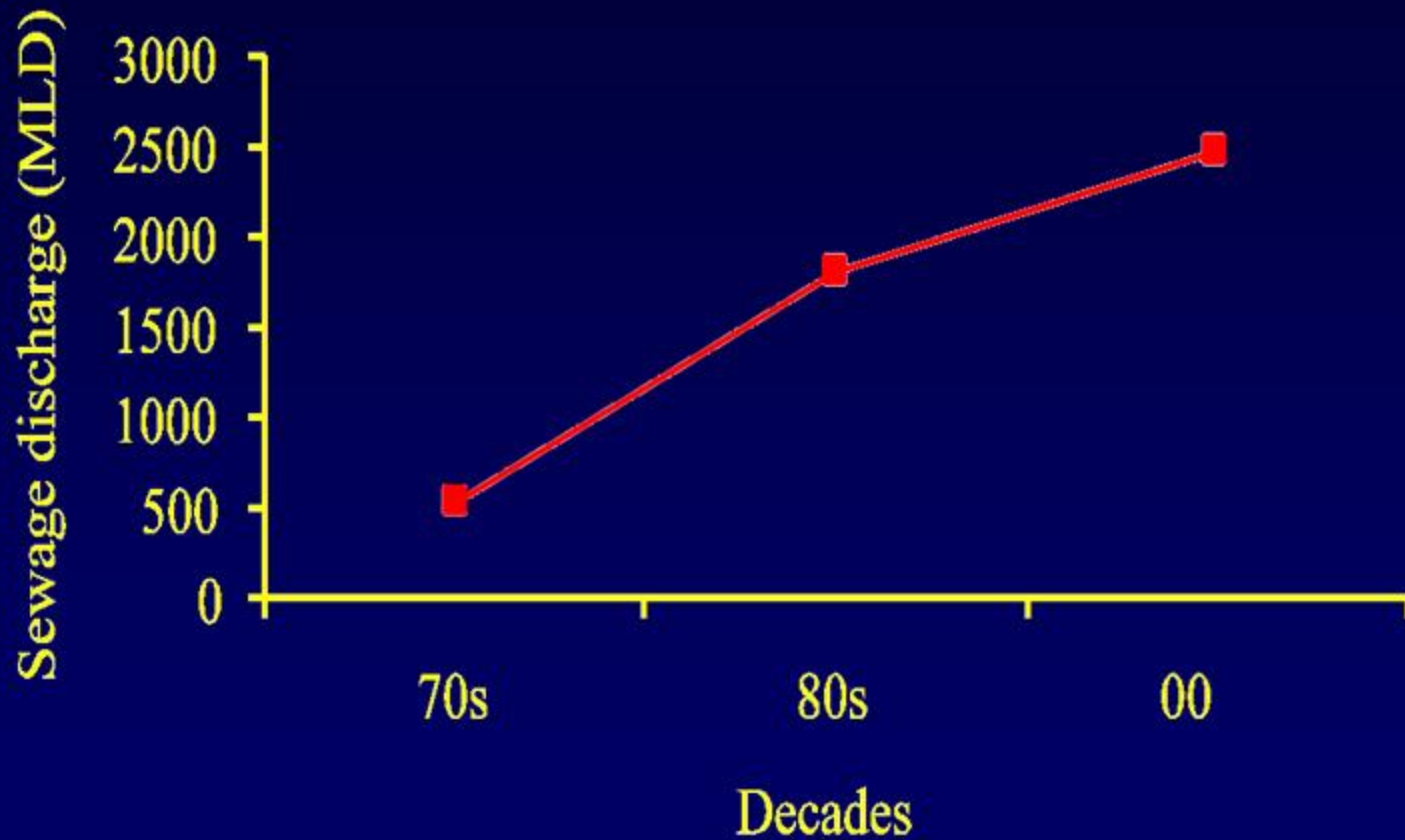

# Population growth

# Industrial growth

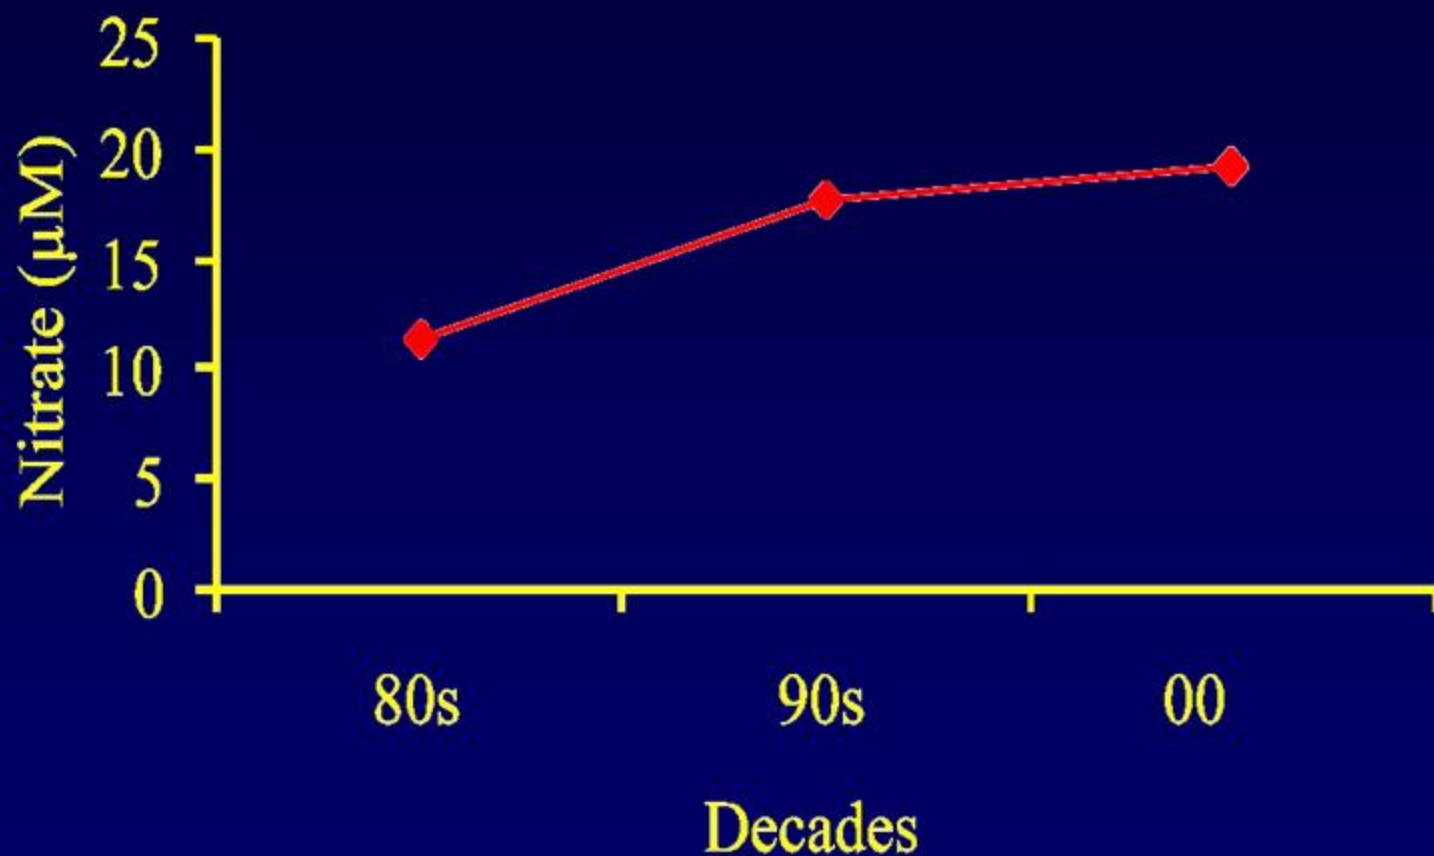

# Sewage discharge

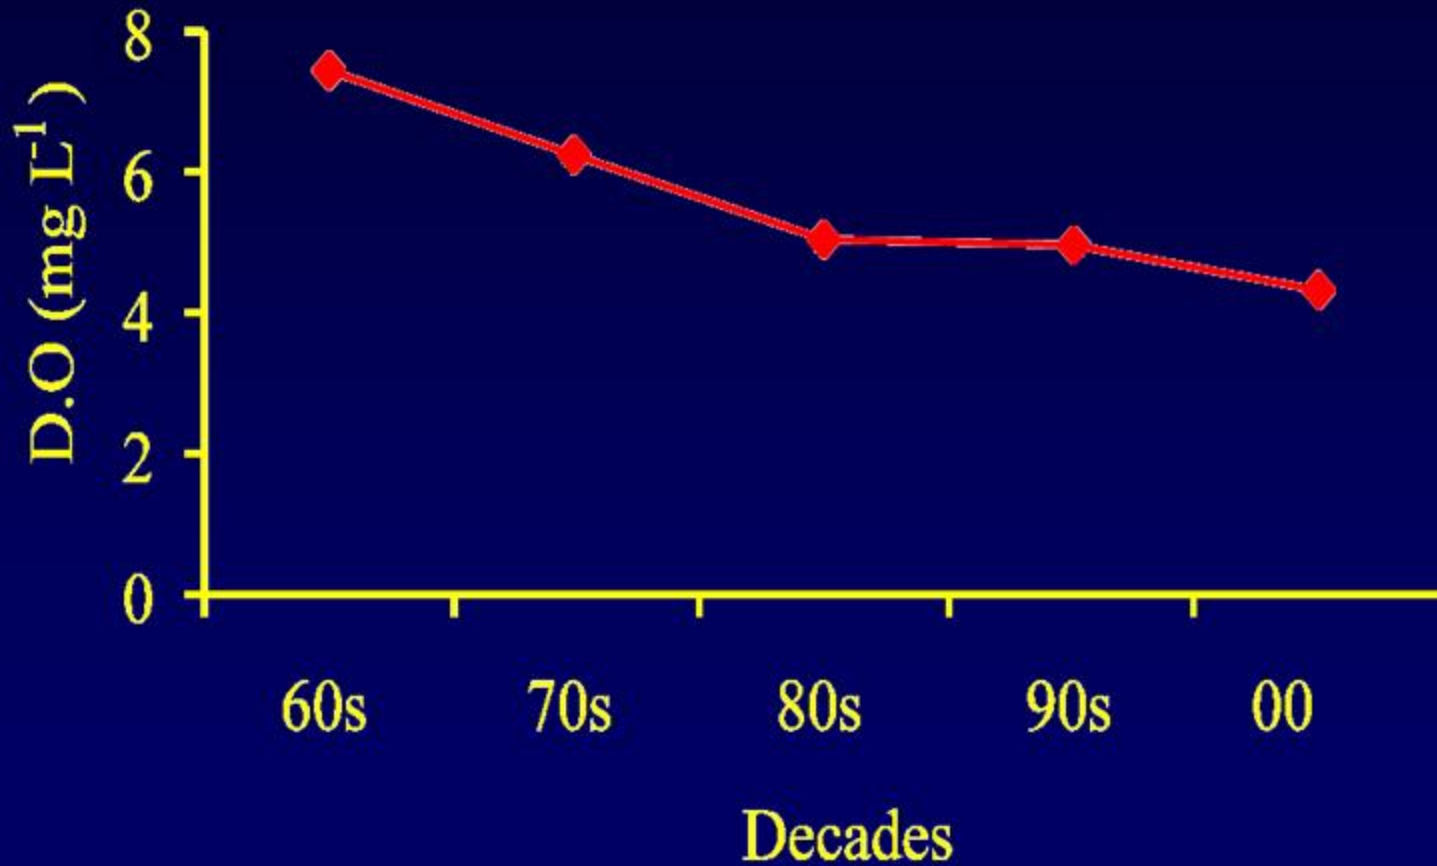

# Changes in the environmental scenario

## Nitrate

# Dissolved oxygen

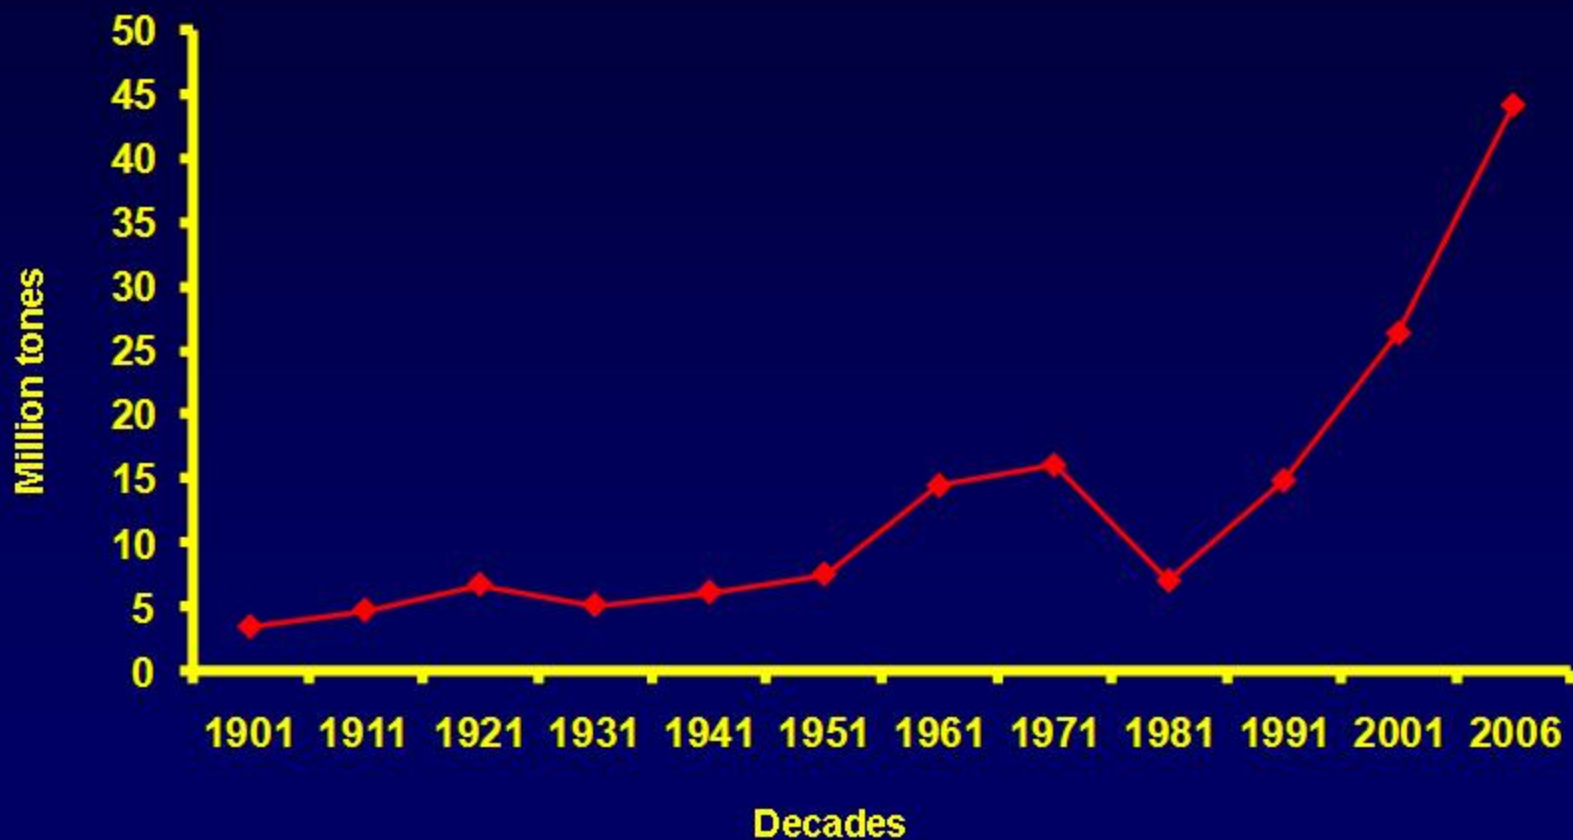

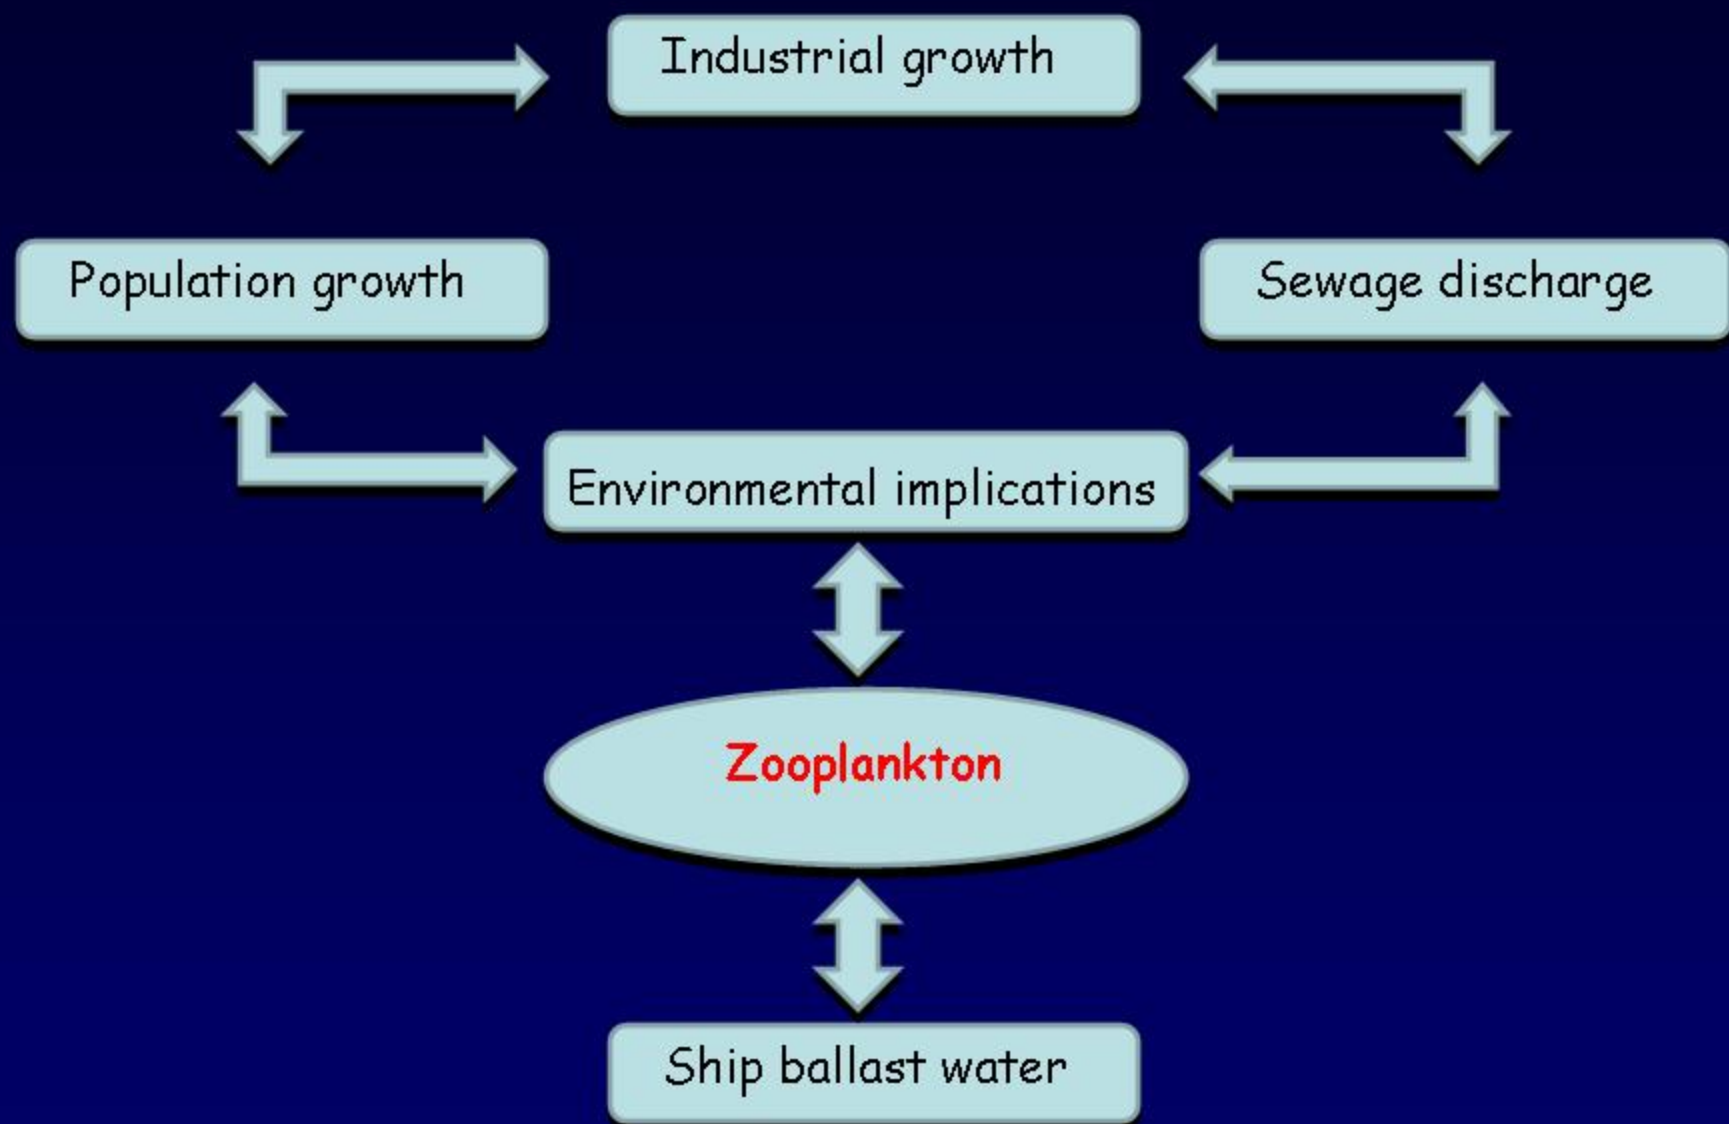

# Apart from receiving sewage & industrial waste:

Mumbai harbour environment is also subjected to wide range of pollutants and biota through ship ballast water

## Decadal marine traffic growth (in terms of cargo handled)

To evaluate the impact of these activities and to elucidate the possible changes in the community structure of zooplankton :

The investigation is carried out in Mumbai port

# Stations

- ❖ 14 stations selected in and around the area
- ❖ Samples collected during 3 different periods between 2001 & 2002 as a part of Global Ballast Water Management Programme

# Methodology

- ❖ Horizontal hauls made with the help of 100  $\mu$  mesh Haron-Trantor net with a flow meter attached

# Results

❖ 25 different zooplankton groups & 23 copepod species recorded

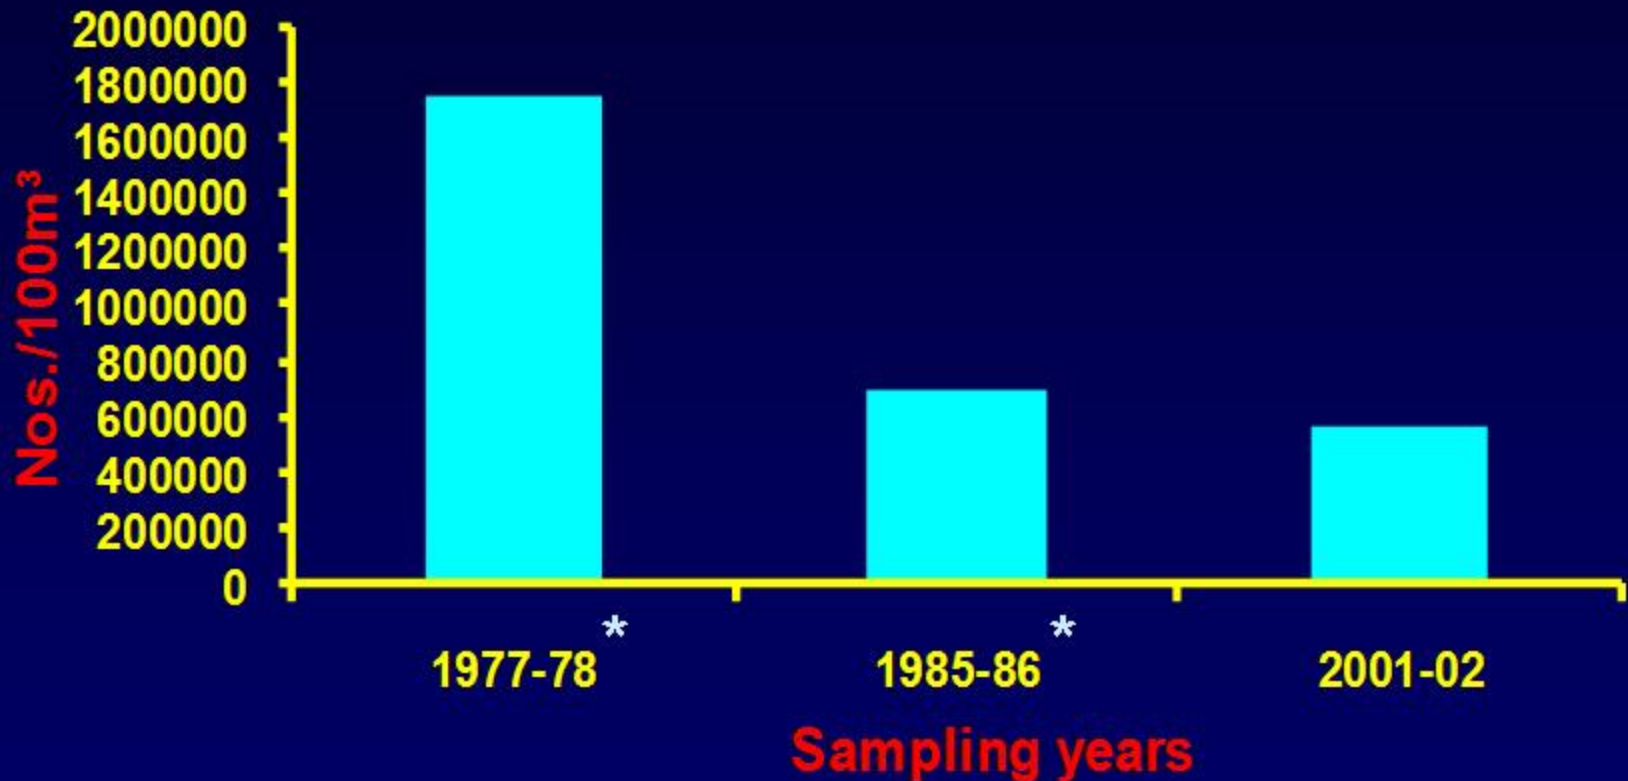

- ❖ But over the years zooplankton abundance has decreased

# Zooplankton abundance

\* Gajbhiye & Desai, Mahasagar, 1981; Lodh, PhD Thesis, Bom, Univ. 1990

- ❖ Data is also compared since 1940's

# Groups not encountered

- Cladocerans
- Ostracods
- Mysids
- Isopods

## Groups recorded

- Cyphonautes larvae
- Ascidian tadpole

### Copepods

- *Canthocalanus* sp.
- *Cosmocalanus* sp.
- *Nanocalanus* sp.
- *Tortanus* sp.
- *Euterpina acutifrons*
- *Nanocalanus minor*
- *Paracalanus* sp.?

# Intersampling variations

## Zooplankton total numbers

# Zooplankton biomass

# South-West monsoon pattern

# Satellite image of record heavy rainfall in Mumbai

# Phytoplankton community

## Diatoms

Nov. 01

*Thalassionema nitzschoides*  
dominated

*Pleurosigma* sp.  
dominated

Oct. 02

# Dinoflagellates

Nov. 01

Abundance of  
Autotrophic (Prorocentrum) &  
Heterotrophic (Protoperedinium)  
species

Abundance of  
Mixotrophic (Dinophysis) species

Oct. 02

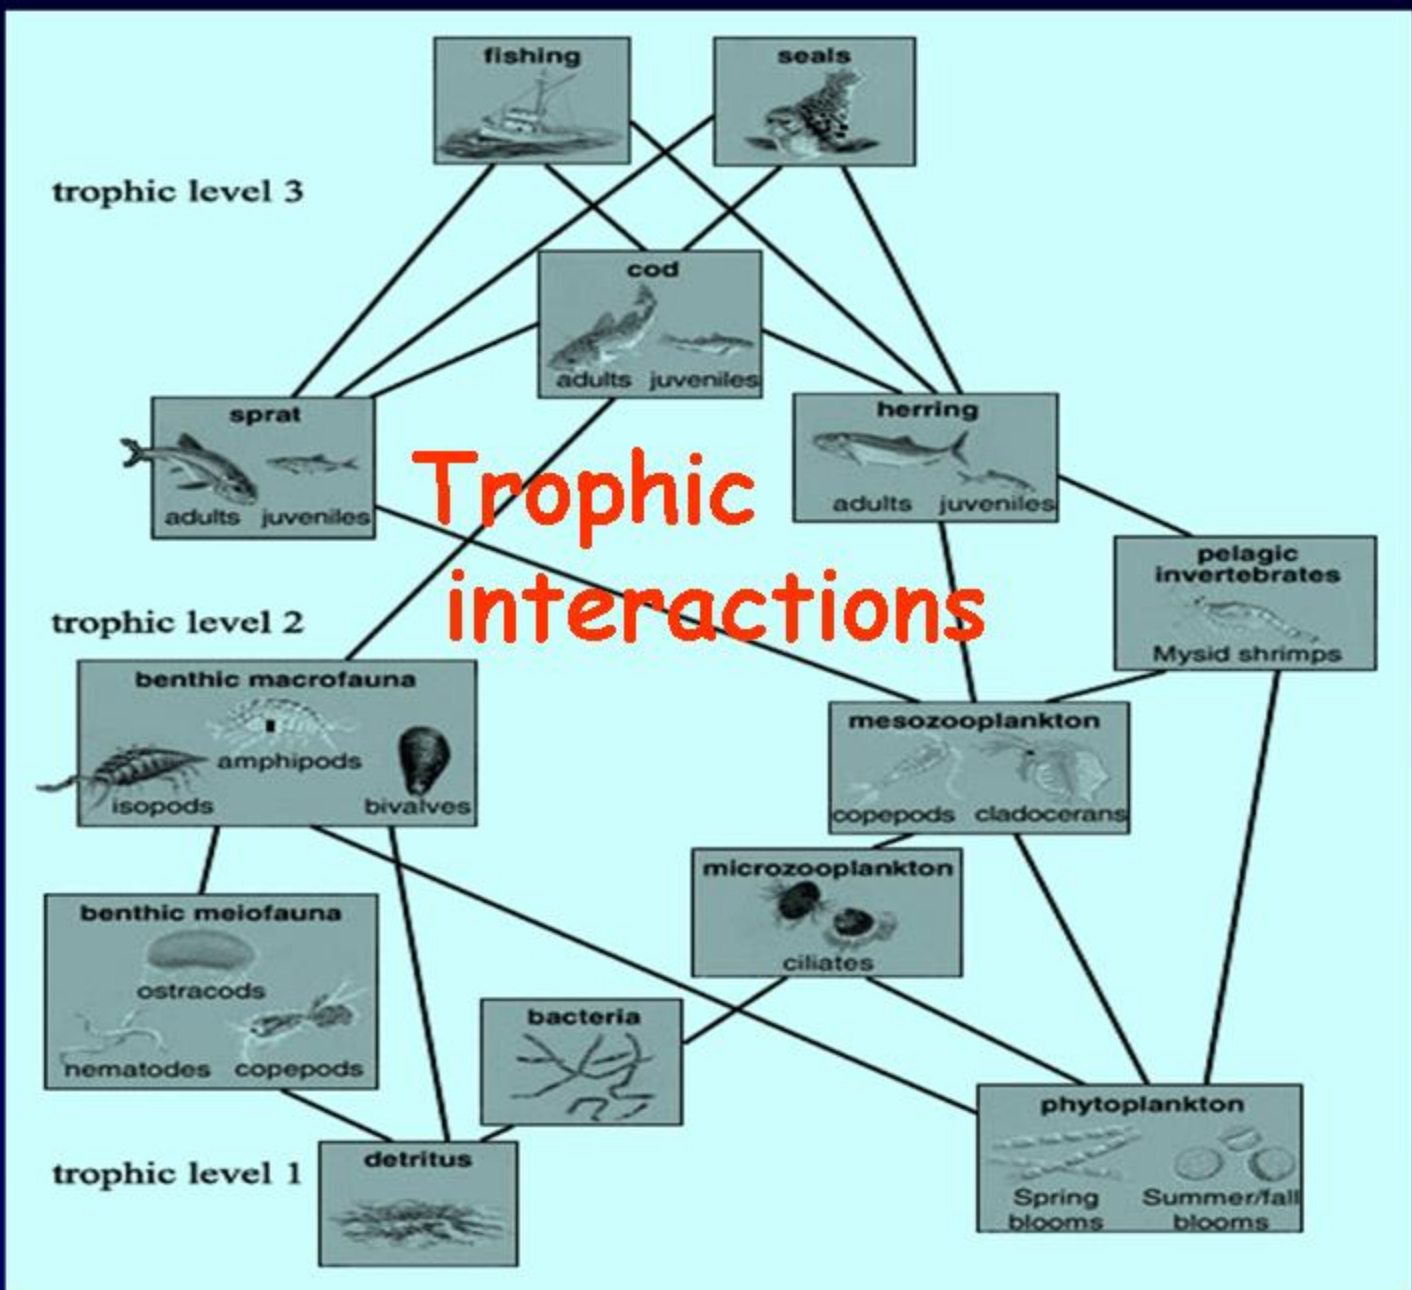

## Copepod community

Nov. 01

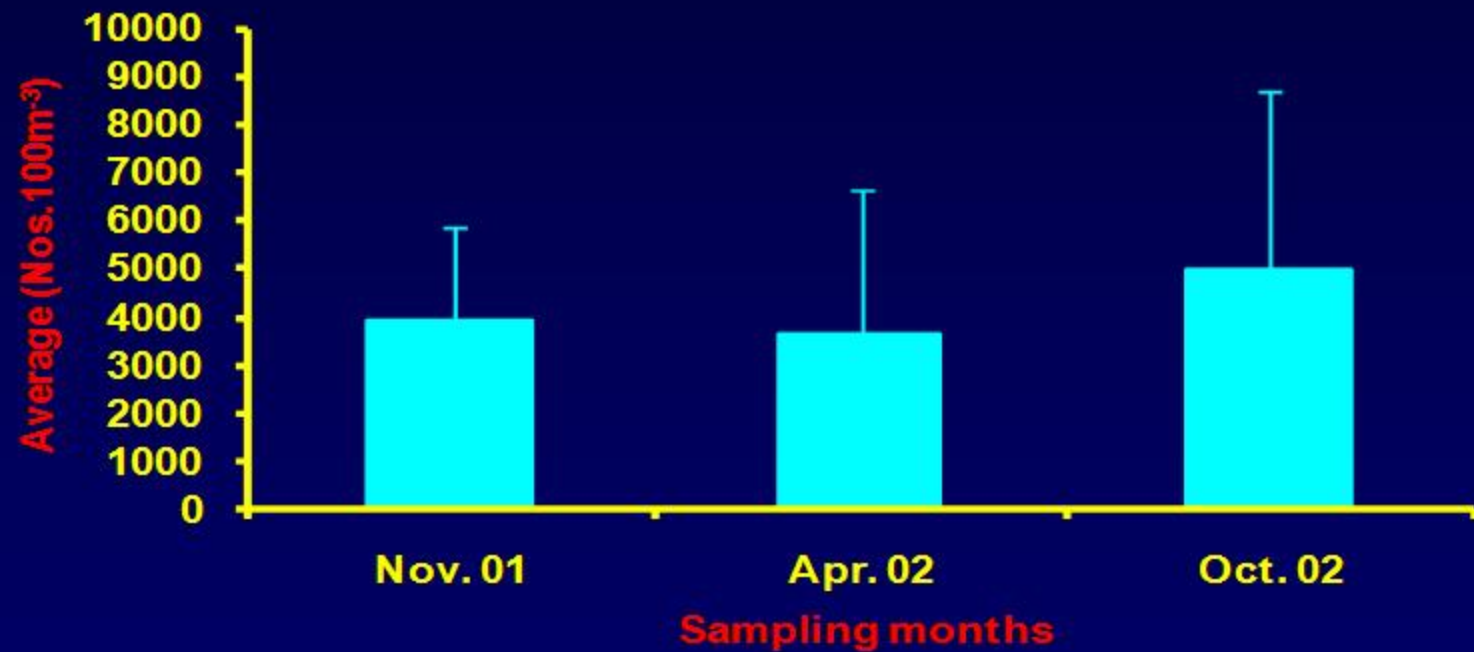

Absence of  
*Microsetella* sp. & *Oncea* sp.

Absence of  
*Acartia centrura* & *Nanocalanus* sp.

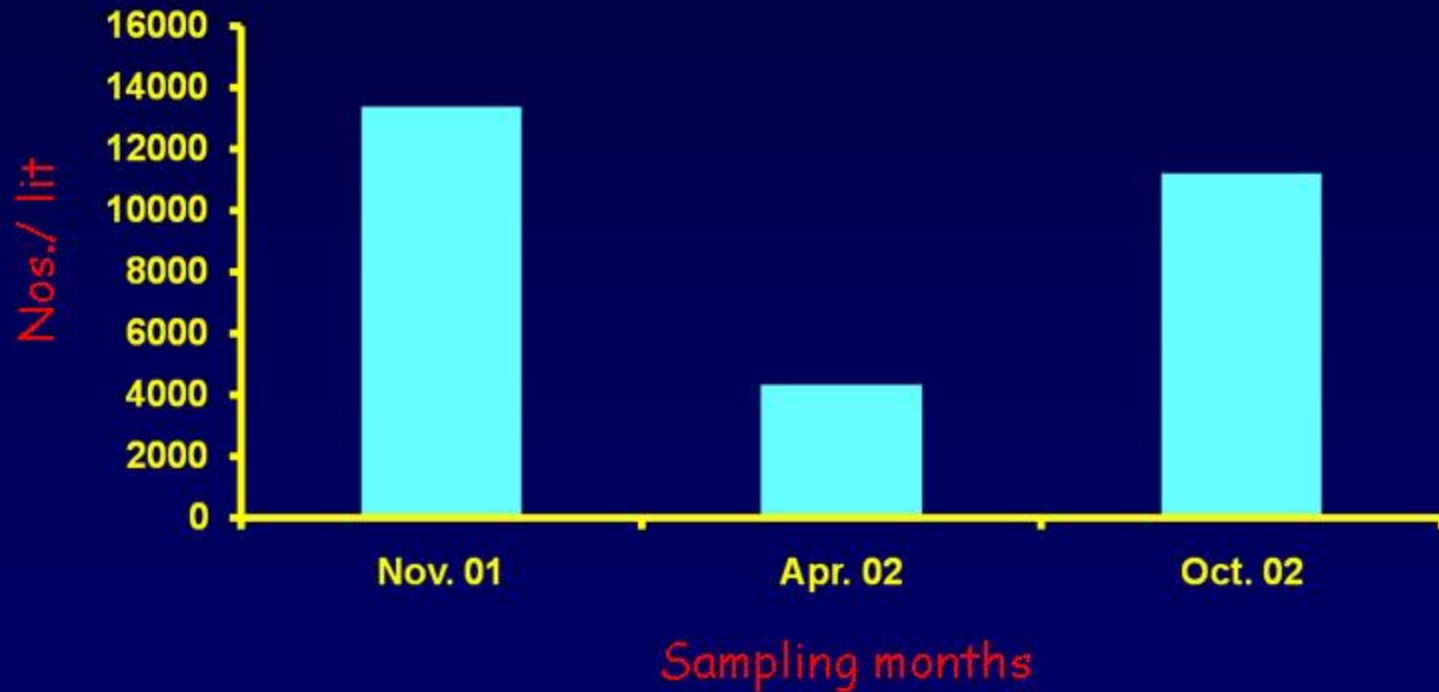

Oct. 02

# Zooplankton

# Phytoplankton

# Bacteria

# Copepods

## Herbivorous

*Nanocalanus minor*  
*Temora discaudata*  
*Paracalanus sp.*

Least % of occurrences  
during pre-monsoon sampling

Attributed to low availability  
of total phytoplankton

## Carnivorous

*Tortanus barbatus*

## Omnivorous

*Centropages furcatus*

*Oithona* sp.

*Corycaeus* sp.

↓  
Abundant during pre-monsoon  
sampling

↓  
Attributed to low phytoplankton &  
increased bacterial numbers

## In conclusion:

- A reflection of mesozooplankton population provides indicative changes in the community structure
- Delineating the causative factors is limited by the methods employed and the observational focus

Thank you
